CMP402

A day in the life of a cloud-empowered aerodynamics engineer

Dr. Neil Ashton

Principal Computational Engineering Solution Architect
AWS

Sean Smith

Sr. Solutions Architect HPC

Agenda

- Introduction to engineering challenges
- What is CFD and the goal of digital certification
- CFD on AWS Reference Architecture
- Live Demo using Siemens Simcenter STAR-CCM+
- Optimizing your cloud CFD setup (Compute, storage, visualization, cost, ML)

How do you design the next generation of X?

Companies need a way to assess the performance and efficiency of new designs

Aerodynamics is key, especially in the age of electric vehicles

They want to go from conceptual design to full design in the shortest possible time with the least expense

Digital certification is the dream for many industries to reduce cost and time compared to physical tests; let's explore that further

Computational fluid dynamics – CFD

No manufacture

Cheap & fast*

Accurate?

Navier-Stokes Equations (1822) – *Claude-Louis Navier & George Gabriel Stokes*

$$\frac{\partial u_i}{\partial x_i} = 0$$

$$\frac{\partial u_i}{\partial t} + u_j \frac{\partial u_i}{\partial x_j} = -\frac{1}{\rho}\frac{\partial p}{\partial x_i} + \frac{\partial \tau_{ij}}{\partial x_j}$$

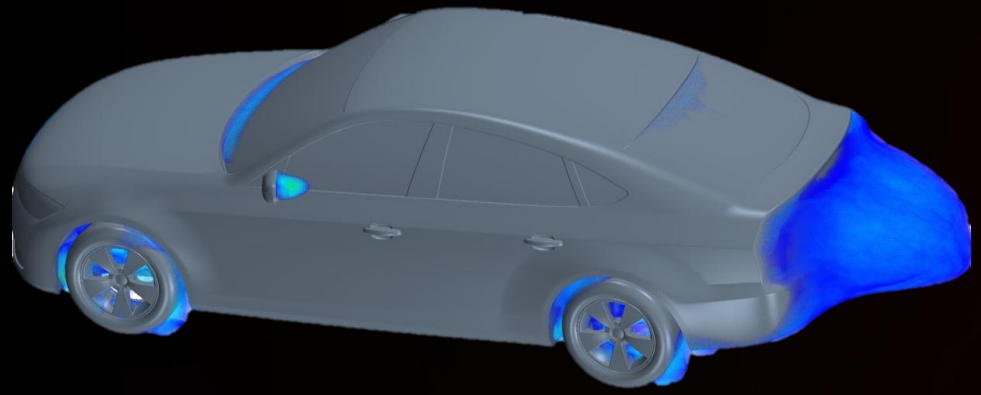

Key tool for digital certification

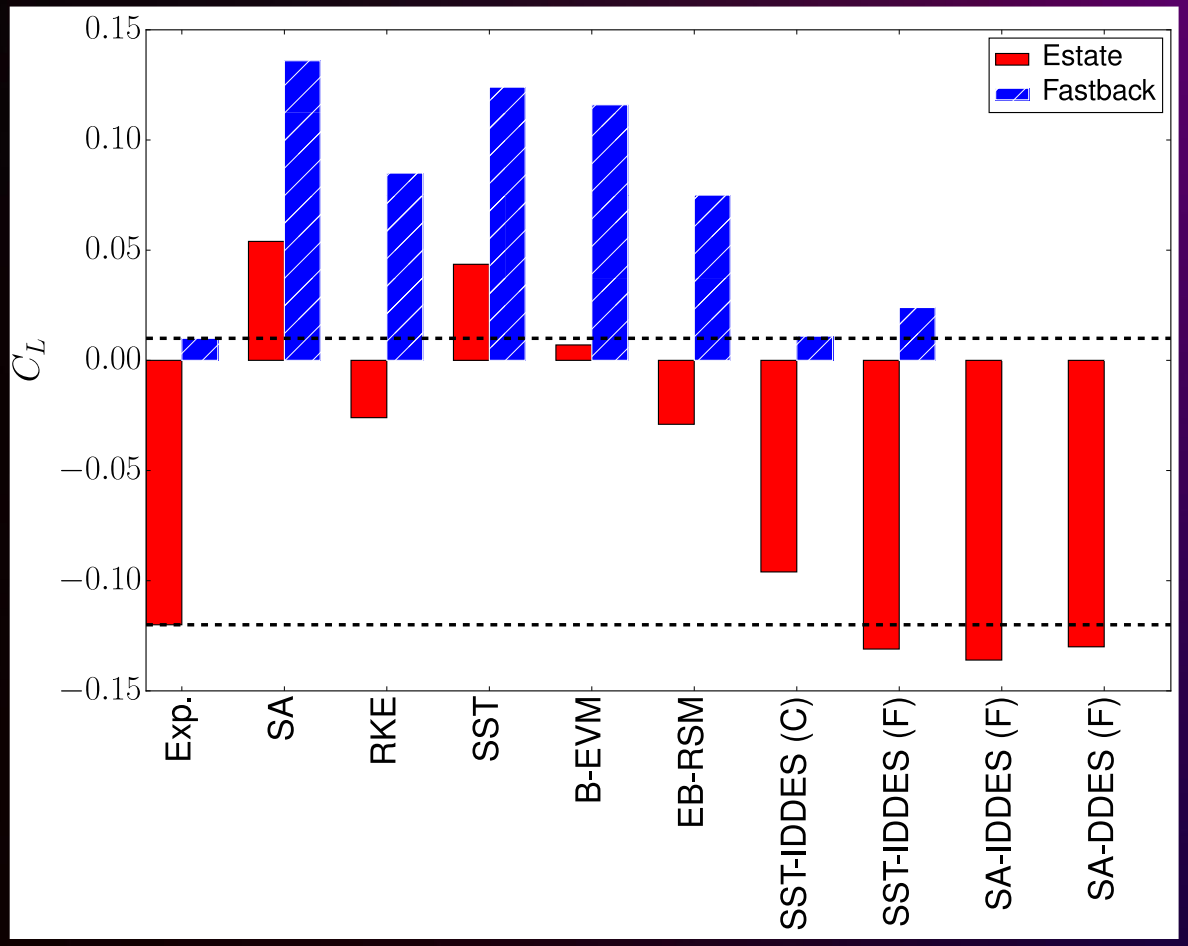

aws

Why high-fidelity CFD? – Automotive

- Improved **accuracy** over low-fidelity methods (e.g., RANS)
- Transient nature means **5x to 20x** more computationally expensive i.e 50k core-hours to 500k core-hours per sim.
- Growing desire from motorsport, automotive, or aerospace to move

N. Ashton, A. West, S. Lardeau, A. Revell, *Assessment of RANS and DES methods for realistic automotive models*, Computers. Fluids. 128 (2016) 1–15. doi:10.1016/j.compfluid.2016.01.008.

Why high-fidelity CFD? – Aerospace

4th High Lift Prediction Workshop

Advance the state of the art for CFD with Boeing/NASA and many others

Supporting evidence

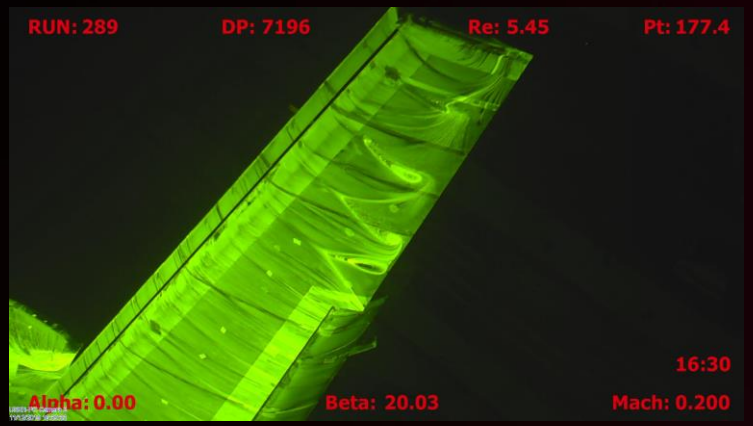

Improved **accuracy** over low-fidelity methods (for example, RANS)

RANS predicts too much outboard and inboard separation

Transient nature means **5x to 20x** more computationally expensive i.e 25k to 500k core-hours. 4000 cores for >12hrs

HPC can be the bottleneck

- As we move to higher fidelity methods to move towards purely digital design and digital certification, jobs are going to need thousands of cores per job or tens of GPUs
- Cloud provides the agility and capacity as you need ever greater HPC
- But how does this work in practice? What would the day look like for a cloud-enabled aerodynamics engineer? How do you make sure you have the optimum setup?
- Lets look at the overall architecture and then a live interactive demo!

Multi-node

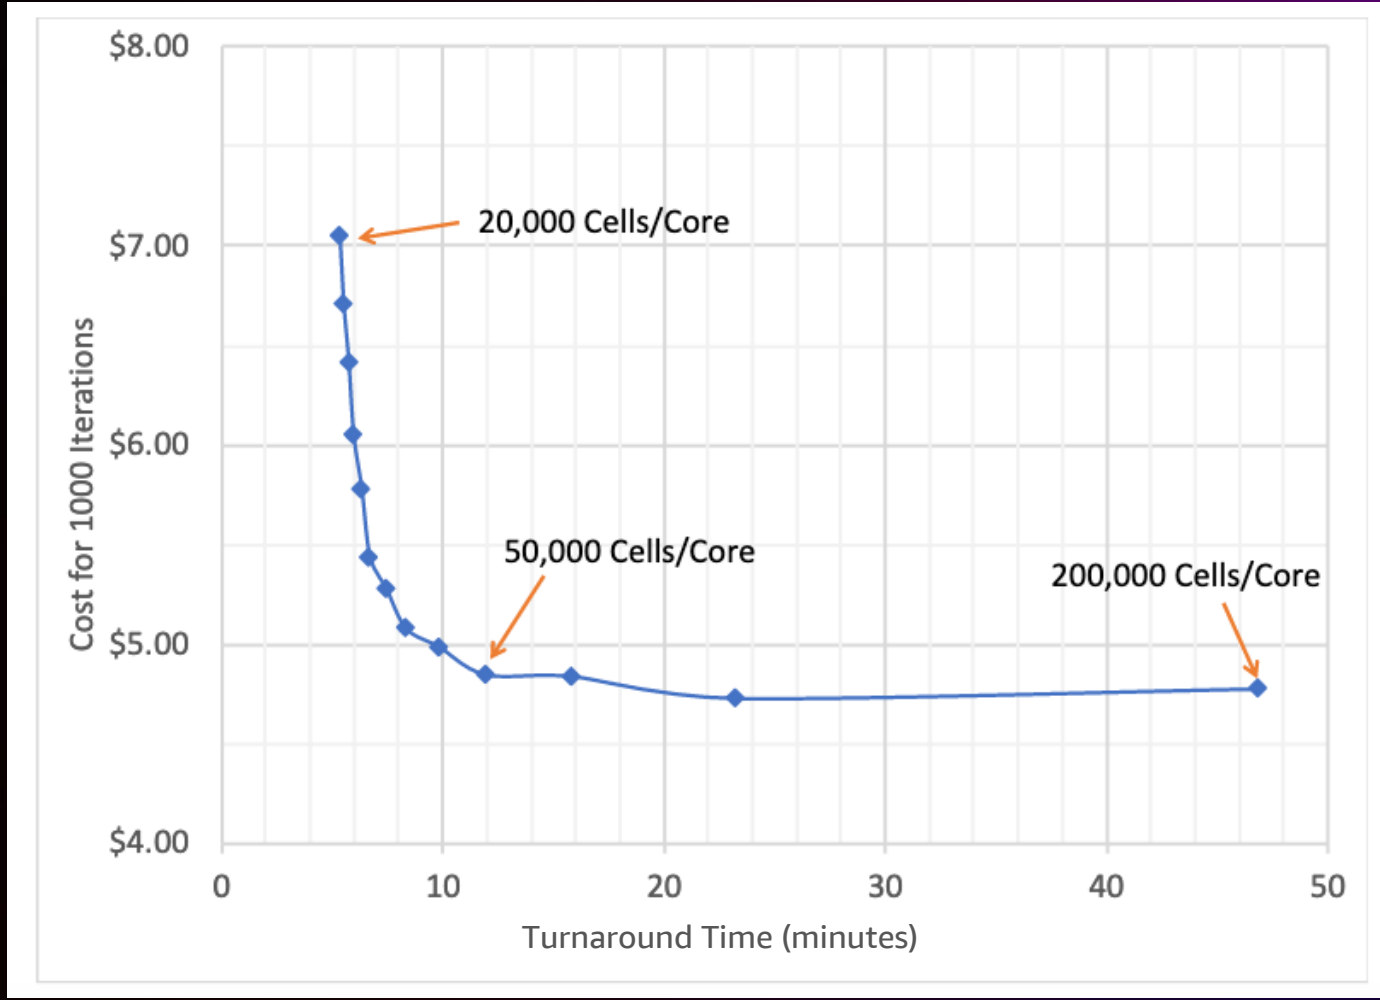

- For multi-node, the network plays a key role
- CFD splits the solution into lots of partitions and then communicates the values around neighboring cells
- Key metric is cells per core

© 2022, Amazon Web Services, Inc. or its affiliates. All rights reserved.

Cells per core

To achieve best parallel efficiency, we recommend greater than **50K cells/core**

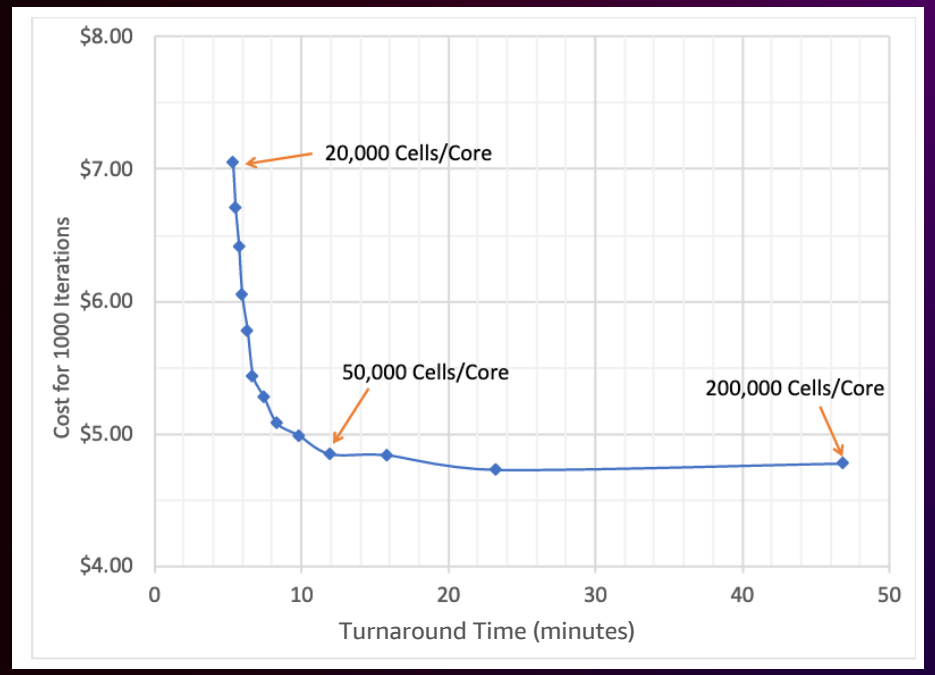

© 2022, Amazon Web Services, Inc. or its affiliates. All rights reserved.

Time to solution vs. cost per simulation

- Optimize compute instance selection and number of instances
- Choose the optimal cells/core for your model
- Optimize storage by using FSx for Lustre as scratch space and Amazon S3 for long-term storage
- Next, look at pricing models such as Spot or Reserved Instances

Evaluate the trade-off of time to solution vs. cost for scaling

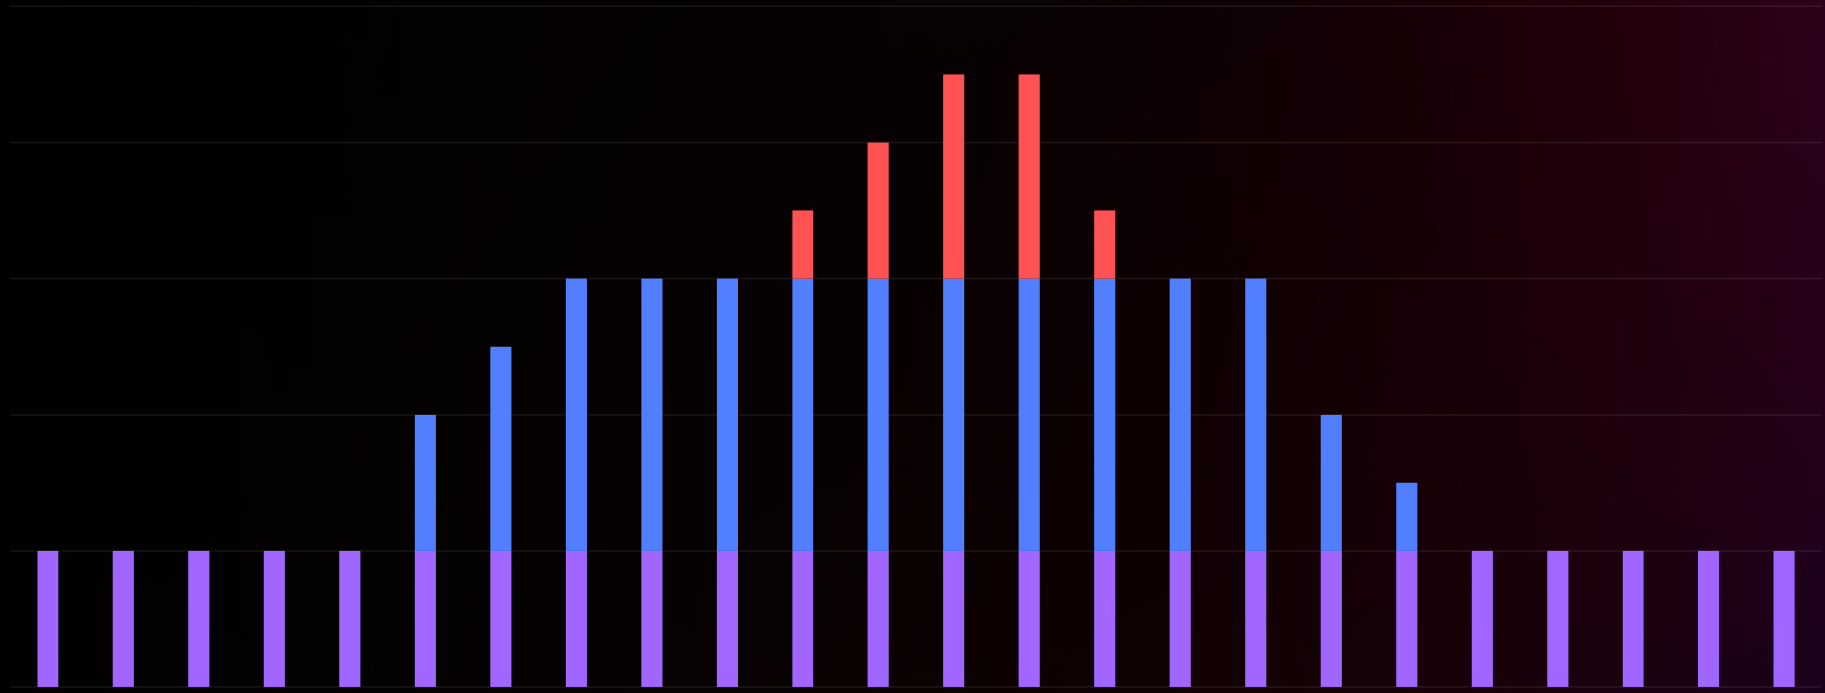

aws

Cost models

Scale using Spot, On-Demand, or both

Use Reserved Instances/Saving Plans for known/steady-state workloads
