Evolution of connected vehicle platforms

- First connected vehicle platform ~25 years ago, CDMA and GPS
- Hardware-based, outsourced to telematics service providers (TSPs)
- On-premises infrastructure, scaled for peak demand
- OEMs, in-house development, 10-year support model
- Cloud migration for ingest and data lakes
- Platform migration/modernization, managed message broker, intelligent data collection

Challenges with connected vehicle platforms

- Automating onboarding and provisioning
- Scalability and elasticity
- High latency and unreliable networks
- Instantaneous bidirectional communication
- Vehicle modeling and uniformity
- Autonomous vehicle data streams
- Platform security and data privacy

WirelessCar

WirelessCar connects millions of vehicles to the cloud using AWS IoT Core

WirelessCar is a provider of digital vehicle services headquartered in Sweden. Founded in 1999, the company has connected more than nine million vehicles in over 100 countries.

CHALLENGE

To support a global fleet of connected vehicles, which rely on IoT technology, WirelessCar needed to manually manage and configure several backend services. The company needed an automated solution to manage these processes.

SOLUTION

By adopting AWS IoT Core, WirelessCar is managing its vehicle fleets at scale without having to manage infrastructure. Using this fully managed solution, the company has reduced manual labor and improved its speed to market.

IMPACT

- Connects millions of vehicles to the cloud
- Supports high availability
- Reduces manual labor with fully managed services

“Using AWS IoT Core, we can save time and reduce the number of resources needed to deliver a solution.”

Henrik Strömberg, solutions architect, WirelessCar

Building a connected vehicle platform

1. Secure vehicle onboarding

- How to establish mutual trust between the vehicle and cloud?
- How to securely deploy secret credentials to the vehicle?

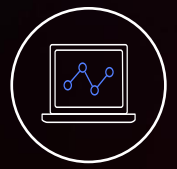

2. Connectivity and control

- How to securely ingest vehicle data into your AWS environment?
- How to securely send commands to vehicles, even with intermittent connectivity?

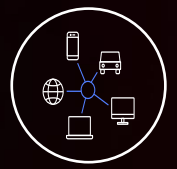

3. Software and data abstraction

- How to extract data from proprietary ECU data formats and networks (e.g., CAN)?
- How to model vehicle data for data analytics, dashboards, and applications?

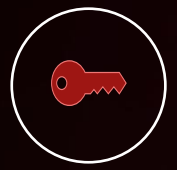

4. Operations

- How to monitor and respond quickly to individual or fleet-wide issues?
- How to safely deploy updates to the platform (OTAs)?

5. Applications

- How to discover problems before a customer does?
- How to develop personalized customer experiences?

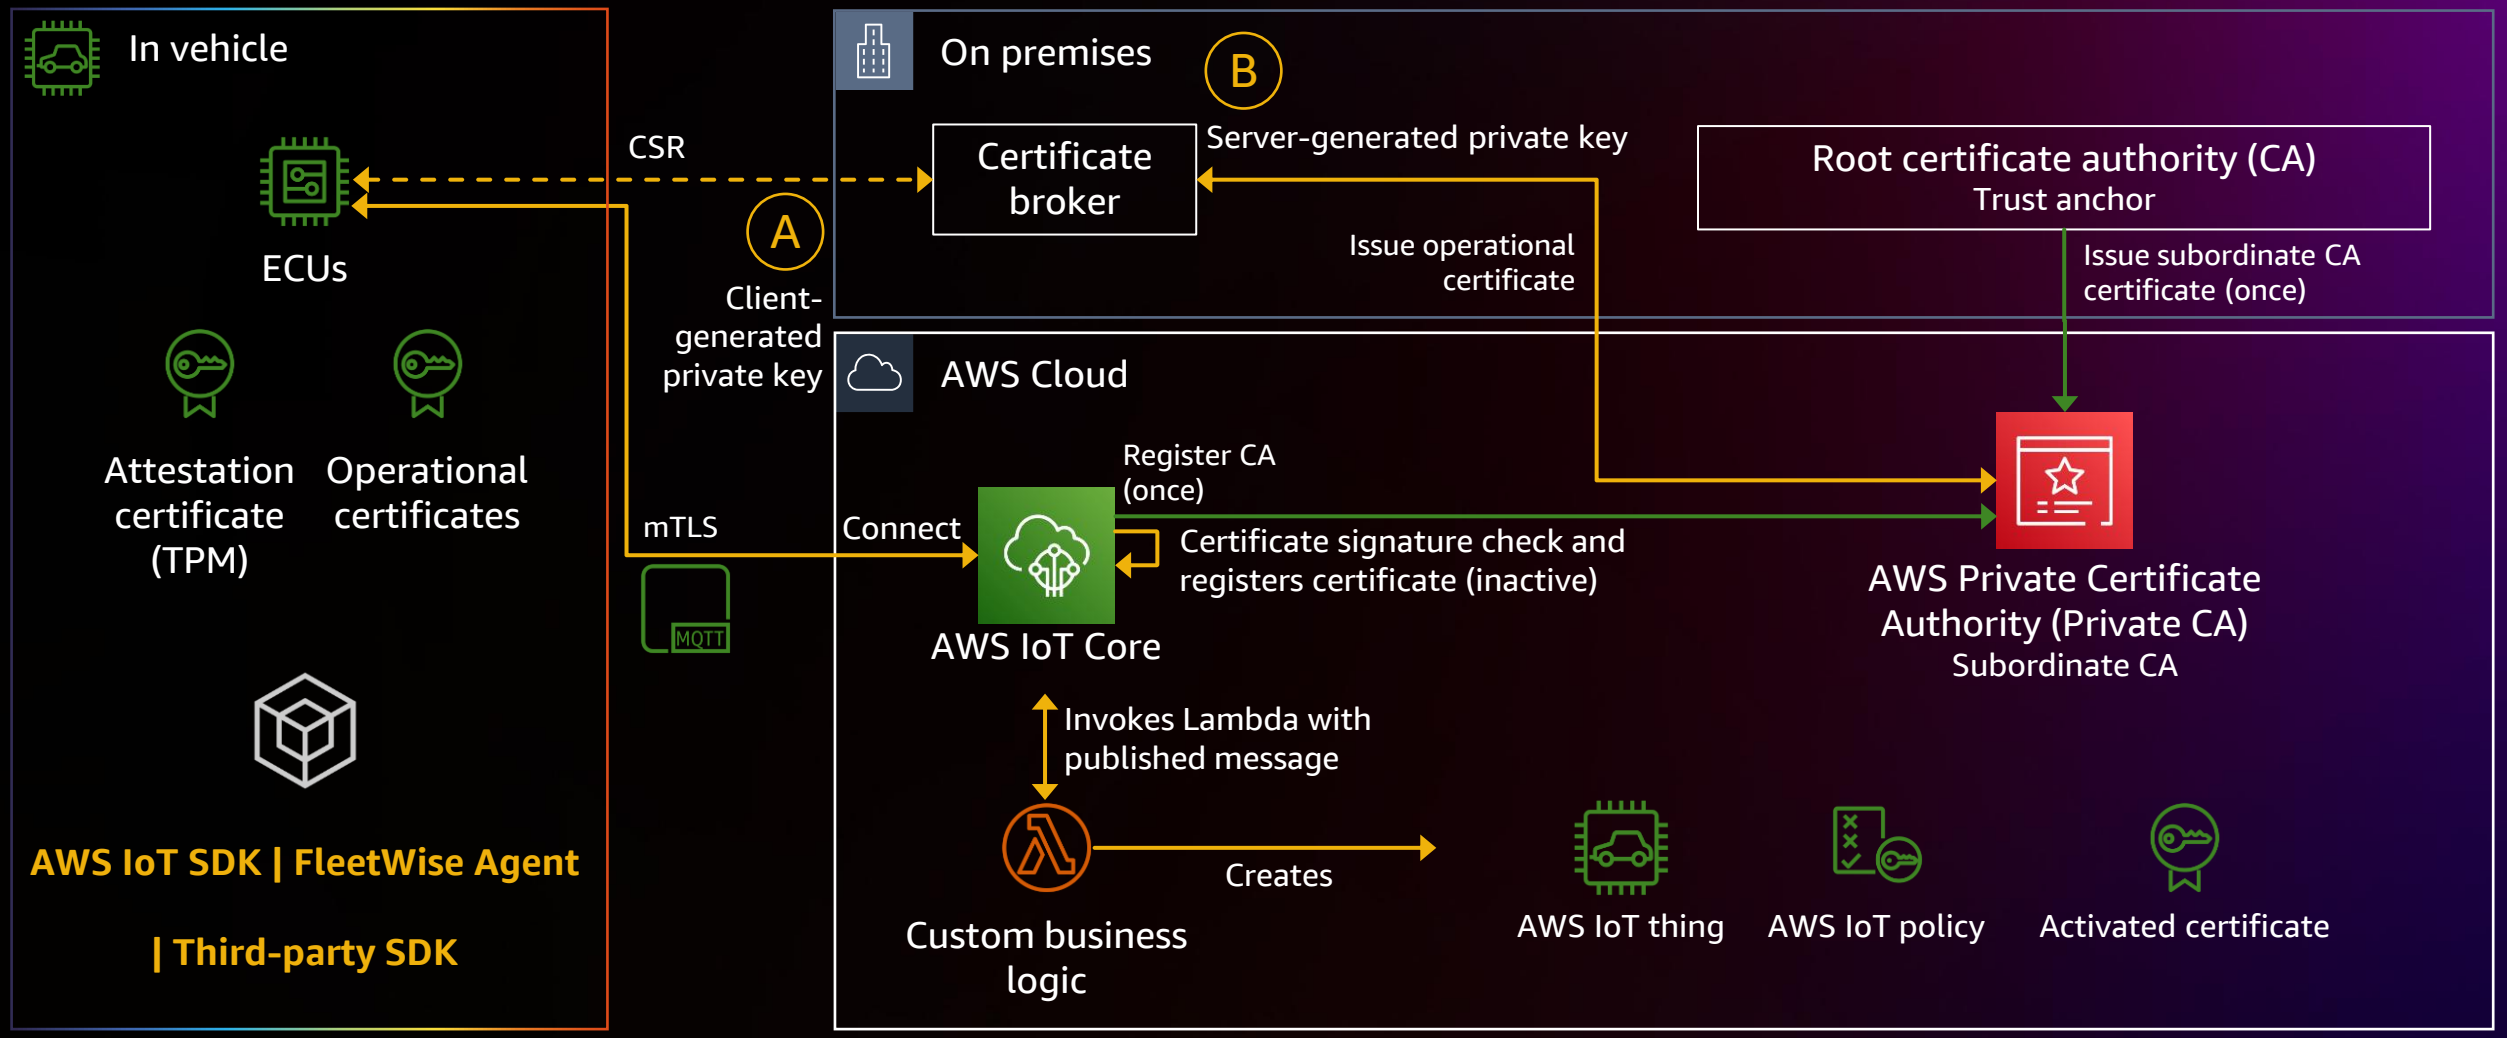

6. End-to-end security and privacy

- How to ensure the whole solution is secure on the vehicle and in the cloud?
- How to comply with data privacy requirements like GDPR (EU) or PIPEDA (Canada)?
