

**SEC301**

# Automating threat detection and response in AWS

**Ross Warren**

**Security Specialist, AWS  
WWCS Geo Solution Architect  
Amazon Web Services**

**Brandon Baxter**

**Solution Architect, ESS Security  
Specialist**

# Workshop agenda

Use US West (Oregon)  
us-west-2

Module 1: Environment setup (20 min.)

Module 2: Attack kickoff and presentation (40 min.)

Module 3: Detect, investigate, and respond (45 min.)

Module 4: Review, questions, and lessons learned (15 min.)

Don't leave after Module 4 – Hands on with Amazon Detective

Please follow directions

# AWS event engine

We will use the AWS event engine; please don't use one of your own accounts

<https://dashboard.eventengine.run>

You will enter the hash that is provided at the URL above

**Event name: Automating threat detection and response in AWS**

1. Click **AWS Console**

2. Click **Open Console**

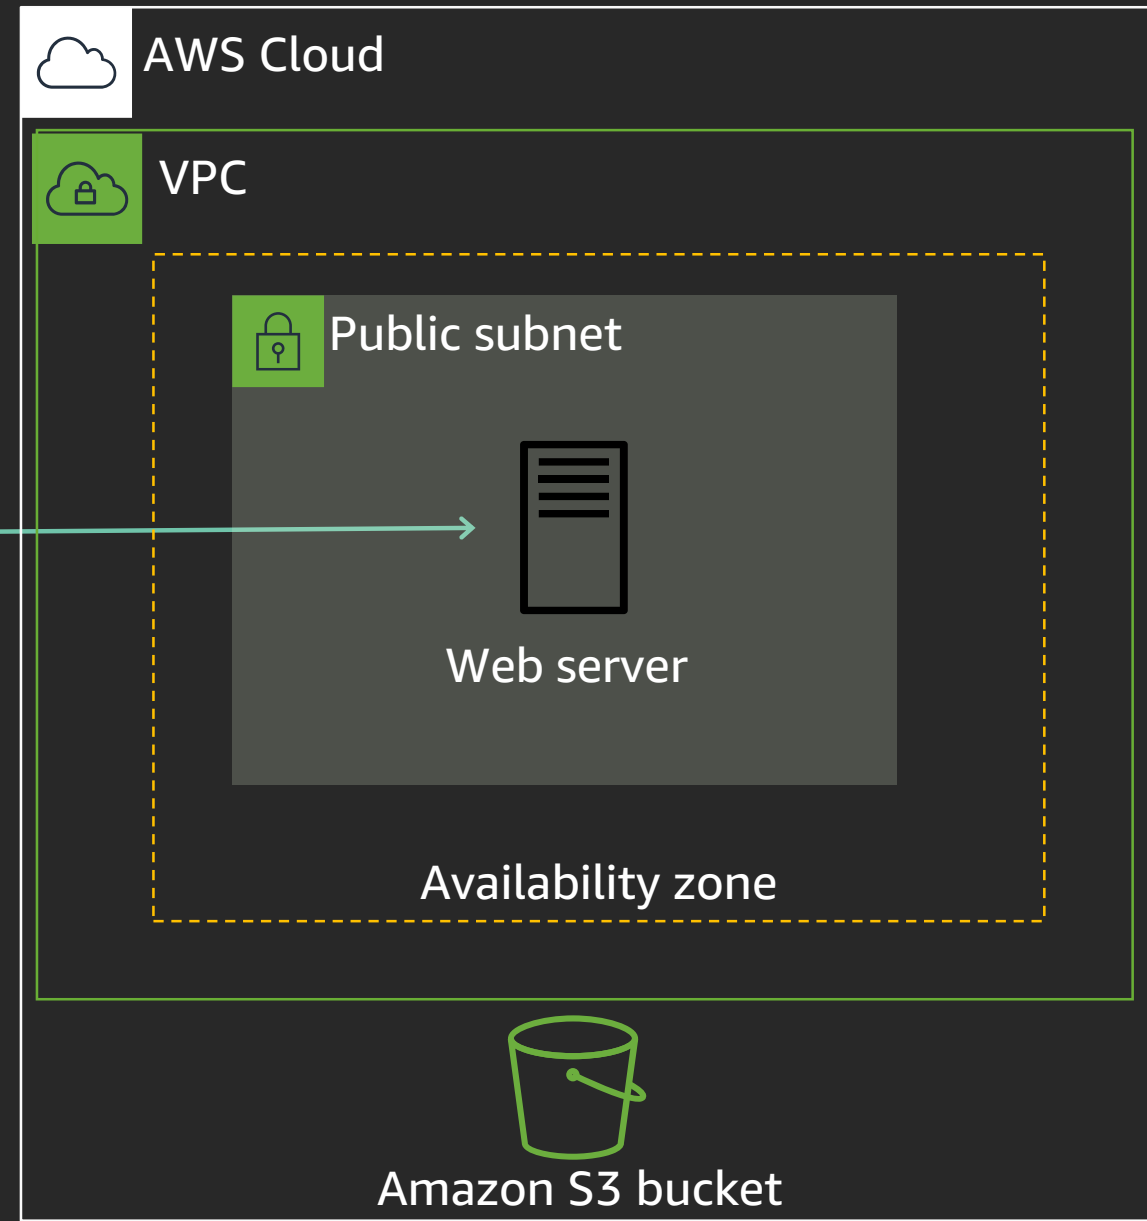

3. Verify that you are in the AWS Management Console in the **us-west-2** Region

# Workshop scenario

## Bare minimum architecture for POC

# Module 1: Build detective controls

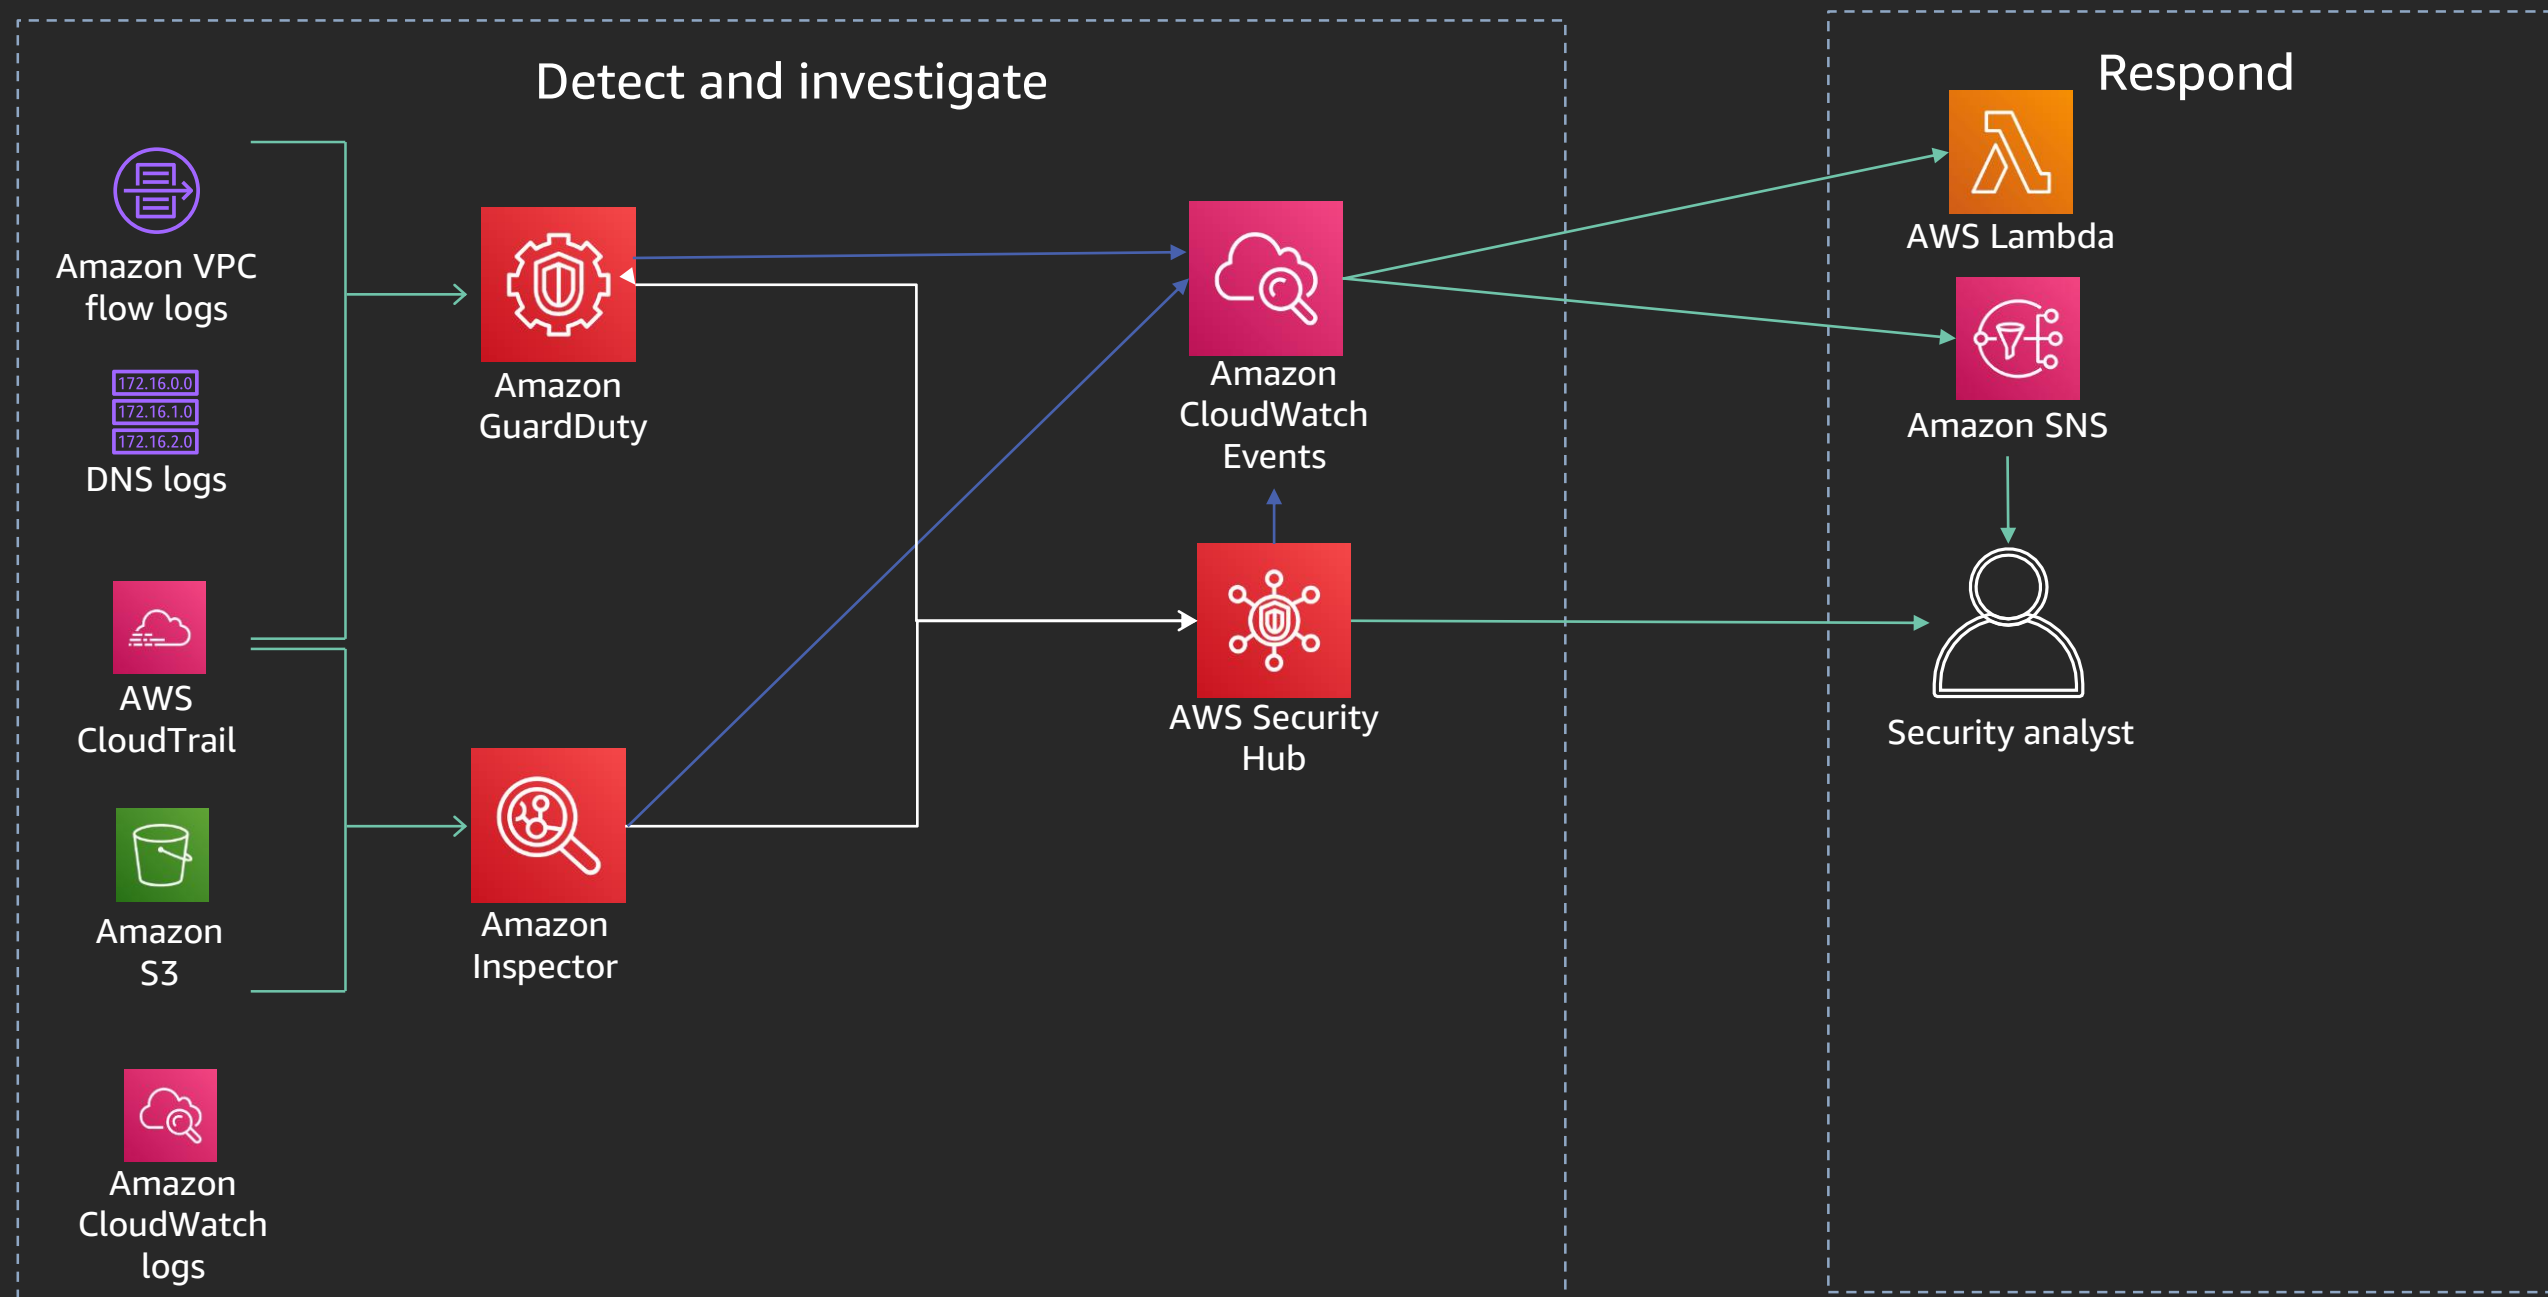

## Run the AWS CloudFormation template (~5 min.)

- Before moving on, make sure the stack status = CREATE\_COMPLETE
- You will get an email from Amazon SNS asking you to confirm the subscription; do this so that you can receive email alerts from AWS services during the workshop

## Manual setup steps (~15 min.)

- Create a Amazon CloudWatch Event Rule
- Enable Amazon GuardDuty
- Enable AWS Security Hub

# Module 1: Build detective controls

# Module 1: Build detective controls

Use US West (Oregon)  
us-west-2

<https://dashboard.eventengine.run>

<https://automating-threat-detection.awssecworkshops.com/>

## Directions

1. Browse to the URL
2. Read through the workshop scenario
3. Choose **Module 1: Environment Build** in the outline on the left
4. Complete the module (~15 min.), and then stop

**Please follow directions**  
Do not skip the manual steps

# Module 2: Attack kickoff

Run the AWS CloudFormation template (~5 min.)

Do not move on to Module 3

Threat detection and response presentation (~30 min.)

Workshop walk-through (~5 min.)

# Module 2: Attack kickoff

Use US West (Oregon)  
us-west-2

<https://dashboard.eventengine.run>

<https://automating-threat-detection.awssecworkshops.com/>

## Directions

1. Browse to the URL
2. Choose **Module 2: Attack Simulation** in the outline on the left
3. Complete the module (~5 min.), and then stop
4. Do not move on to Module 3

# Threat detection and response: Introduction

# Why is threat detection so hard?

Large datasets

Signal to noise

Skills shortage

# Deep set of security tools

## Identity

AWS Identity and Access Management (IAM)  
AWS Single Sign-On  
AWS Directory Service  
Amazon Cognito  
AWS Organizations  
AWS Secrets Manager  
AWS Resource Access Manager

## Detect

AWS Security Hub  
Amazon GuardDuty  
AWS Config  
AWS CloudTrail  
Amazon CloudWatch  
Amazon Virtual Private Cloud (Amazon VPC) flow logs  
Amazon Detective

## Infrastructure protection

AWS Systems Manager  
AWS Shield  
AWS WAF  
(web application firewall)  
AWS Firewall Manager  
Amazon Inspector  
Amazon VPC

## Data protection

AWS Key Management Service (KMS)  
AWS CloudHSM  
AWS Certificate Manager  
Amazon Macie  
Server-side encryption

## Respond

AWS Config rules  
AWS Lambda  
AWS Systems Manager

# **AWS threat detection services**

# Threat detection: Log data inputs

AWS CloudTrail

Track user activity  
and API usage

Flow logs

IP traffic to and from  
network interfaces  
in a VPC

Amazon CloudWatch

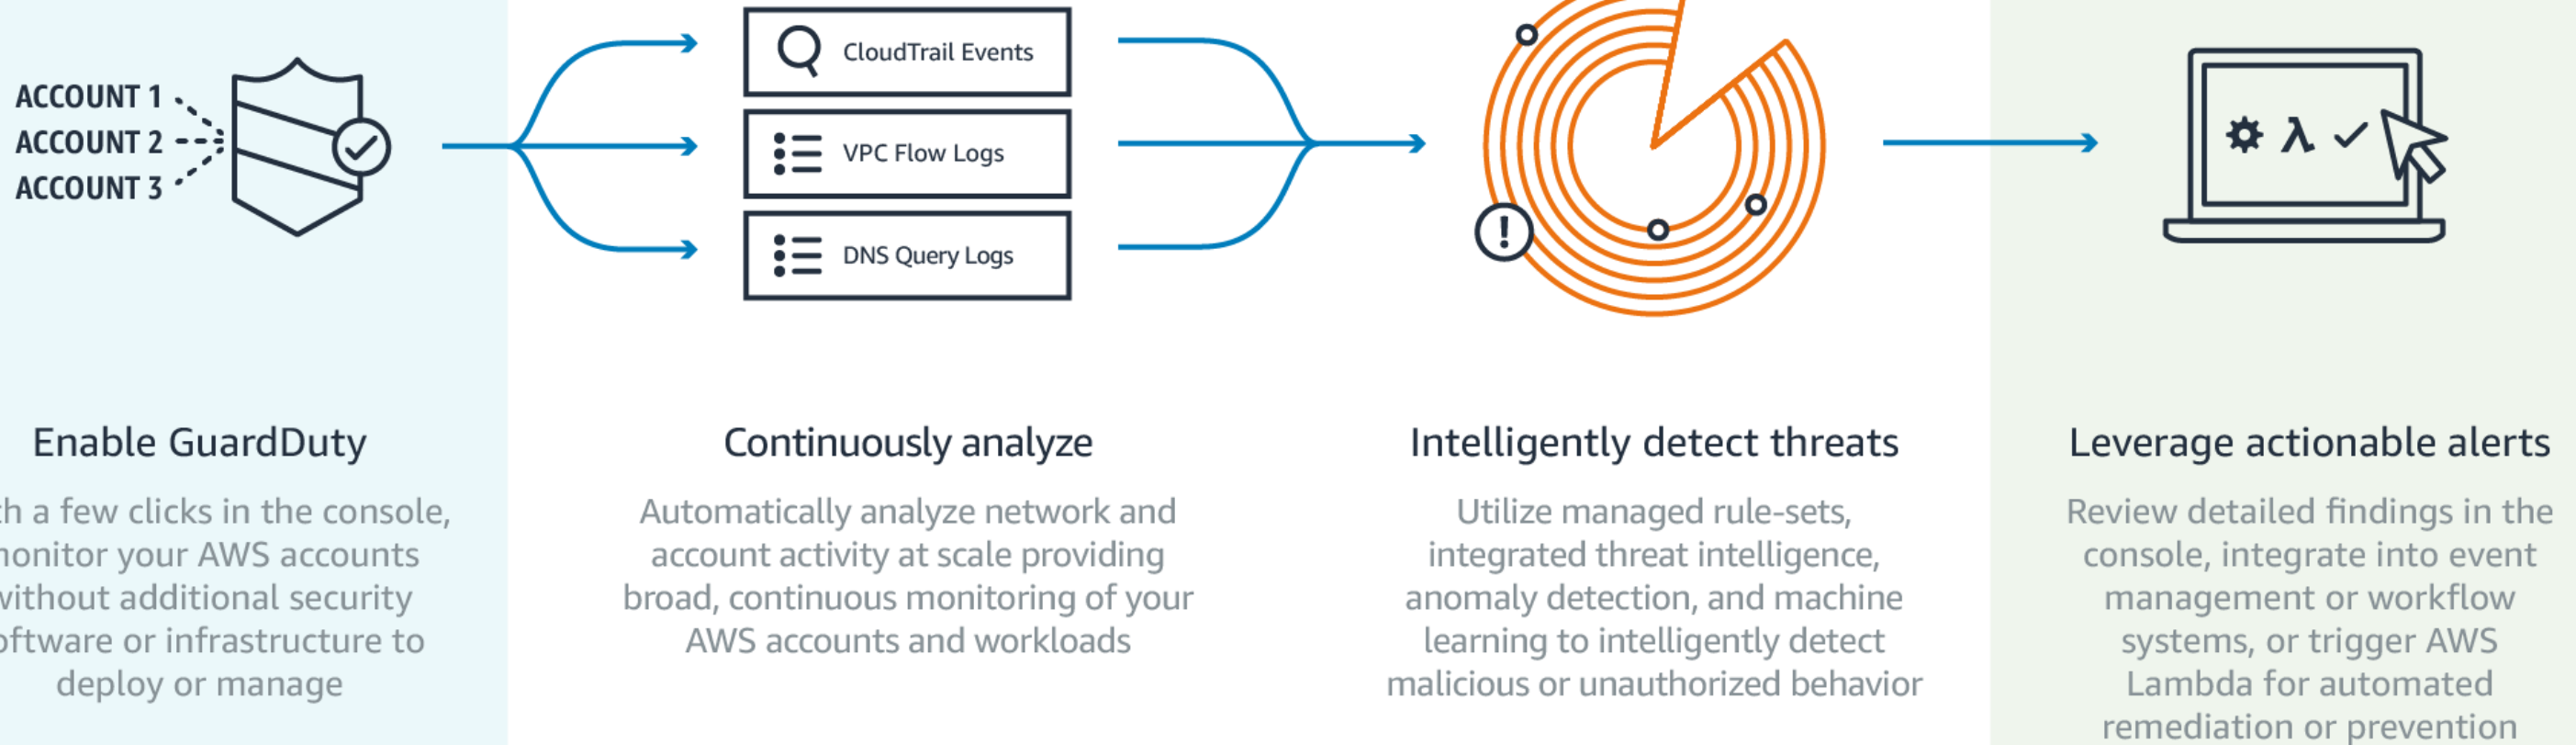

Monitor applications  
using log data; store  
and access log files

DNS logs

Log of DNS queries in  
a VPC when using the  
VPC DNS resolver

# Threat detection: Amazon GuardDuty

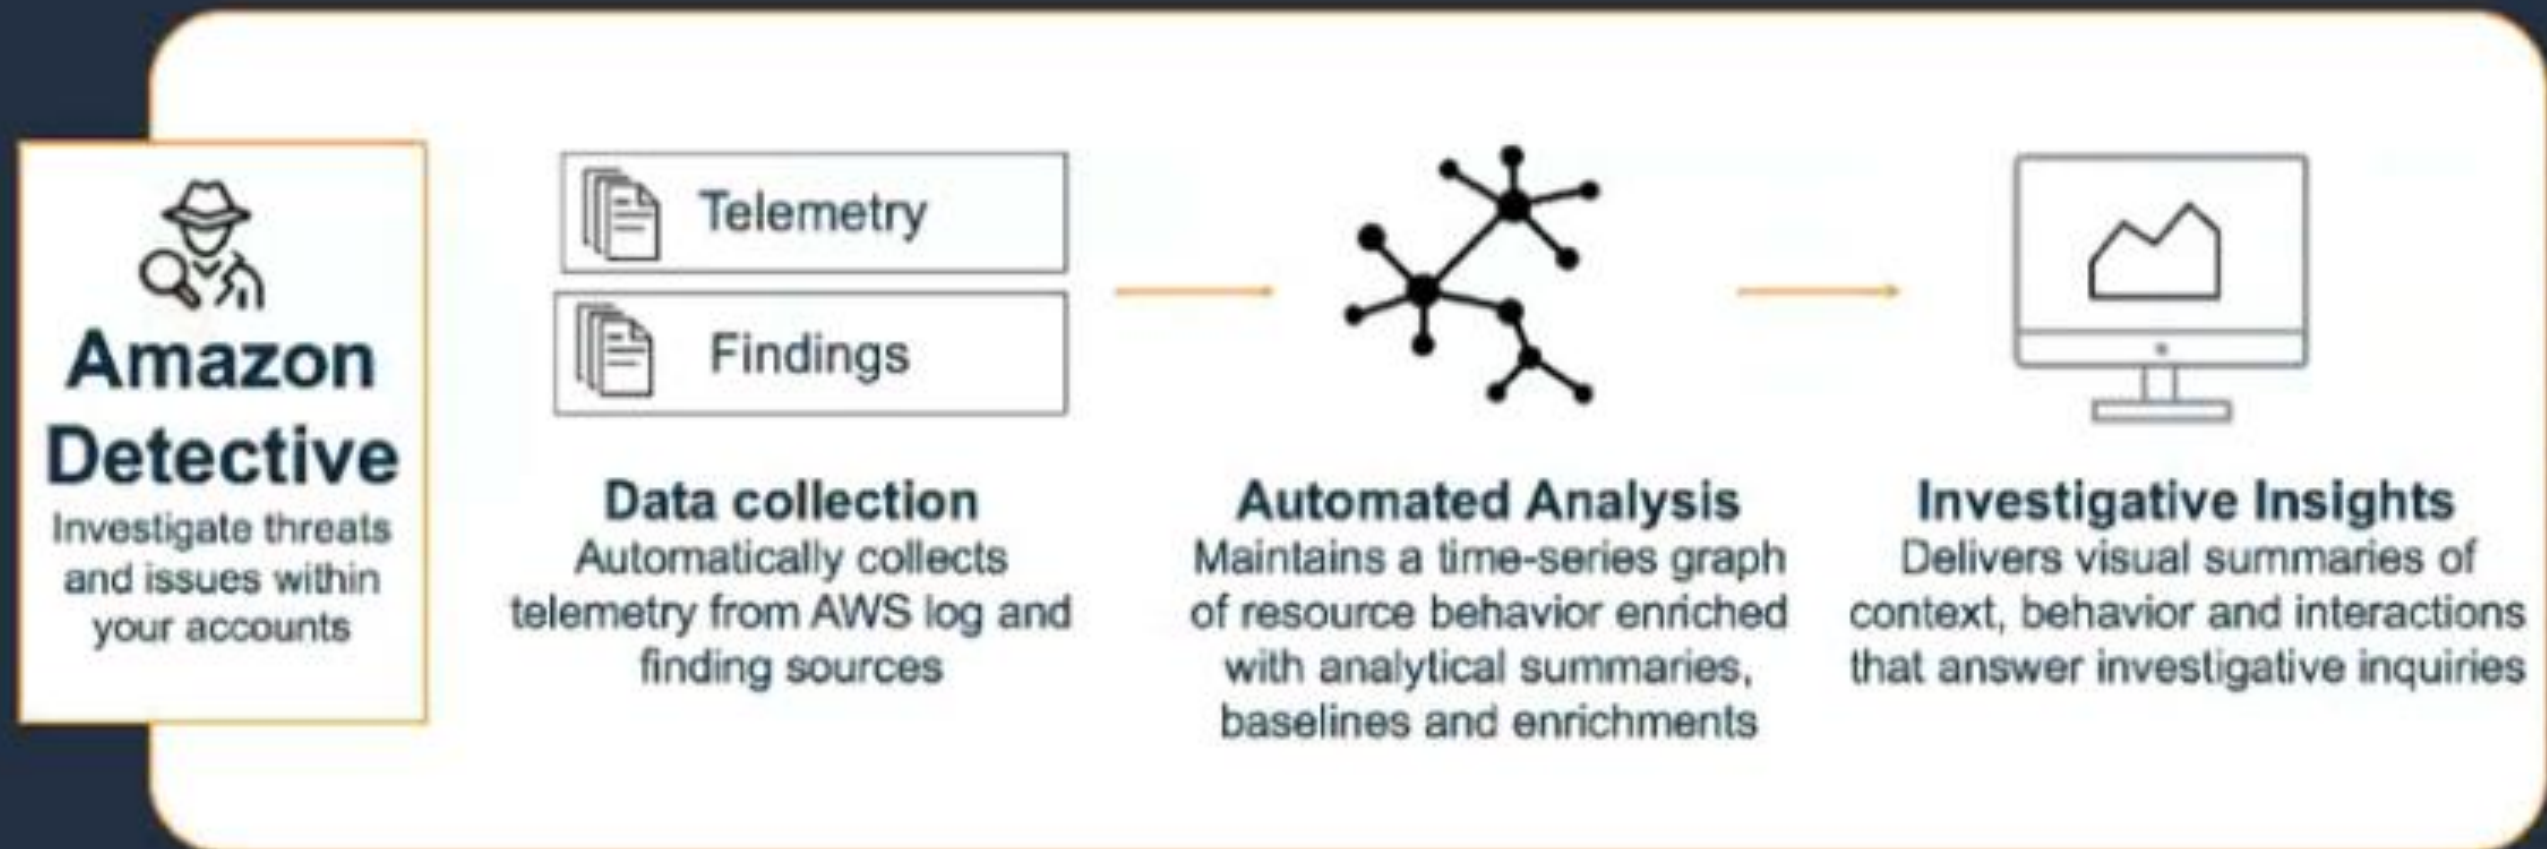

# Threat detection: AWS Security Hub

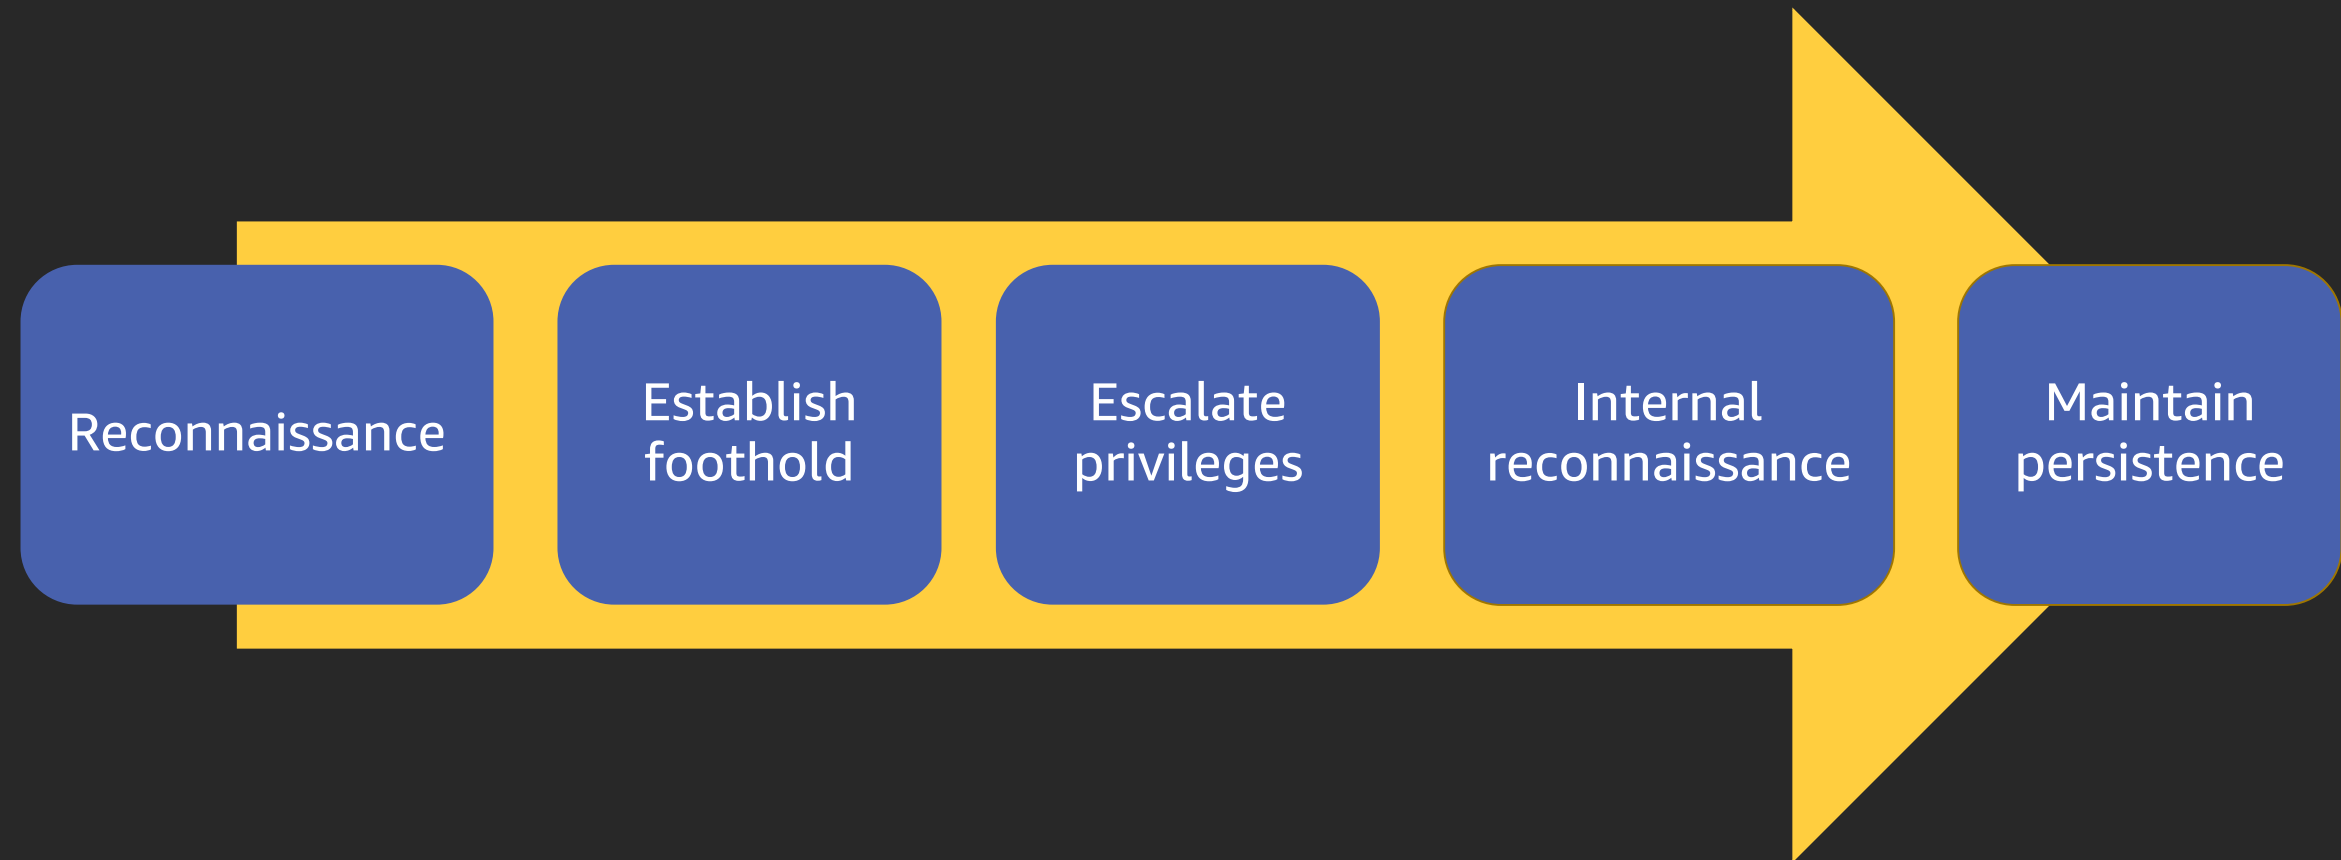

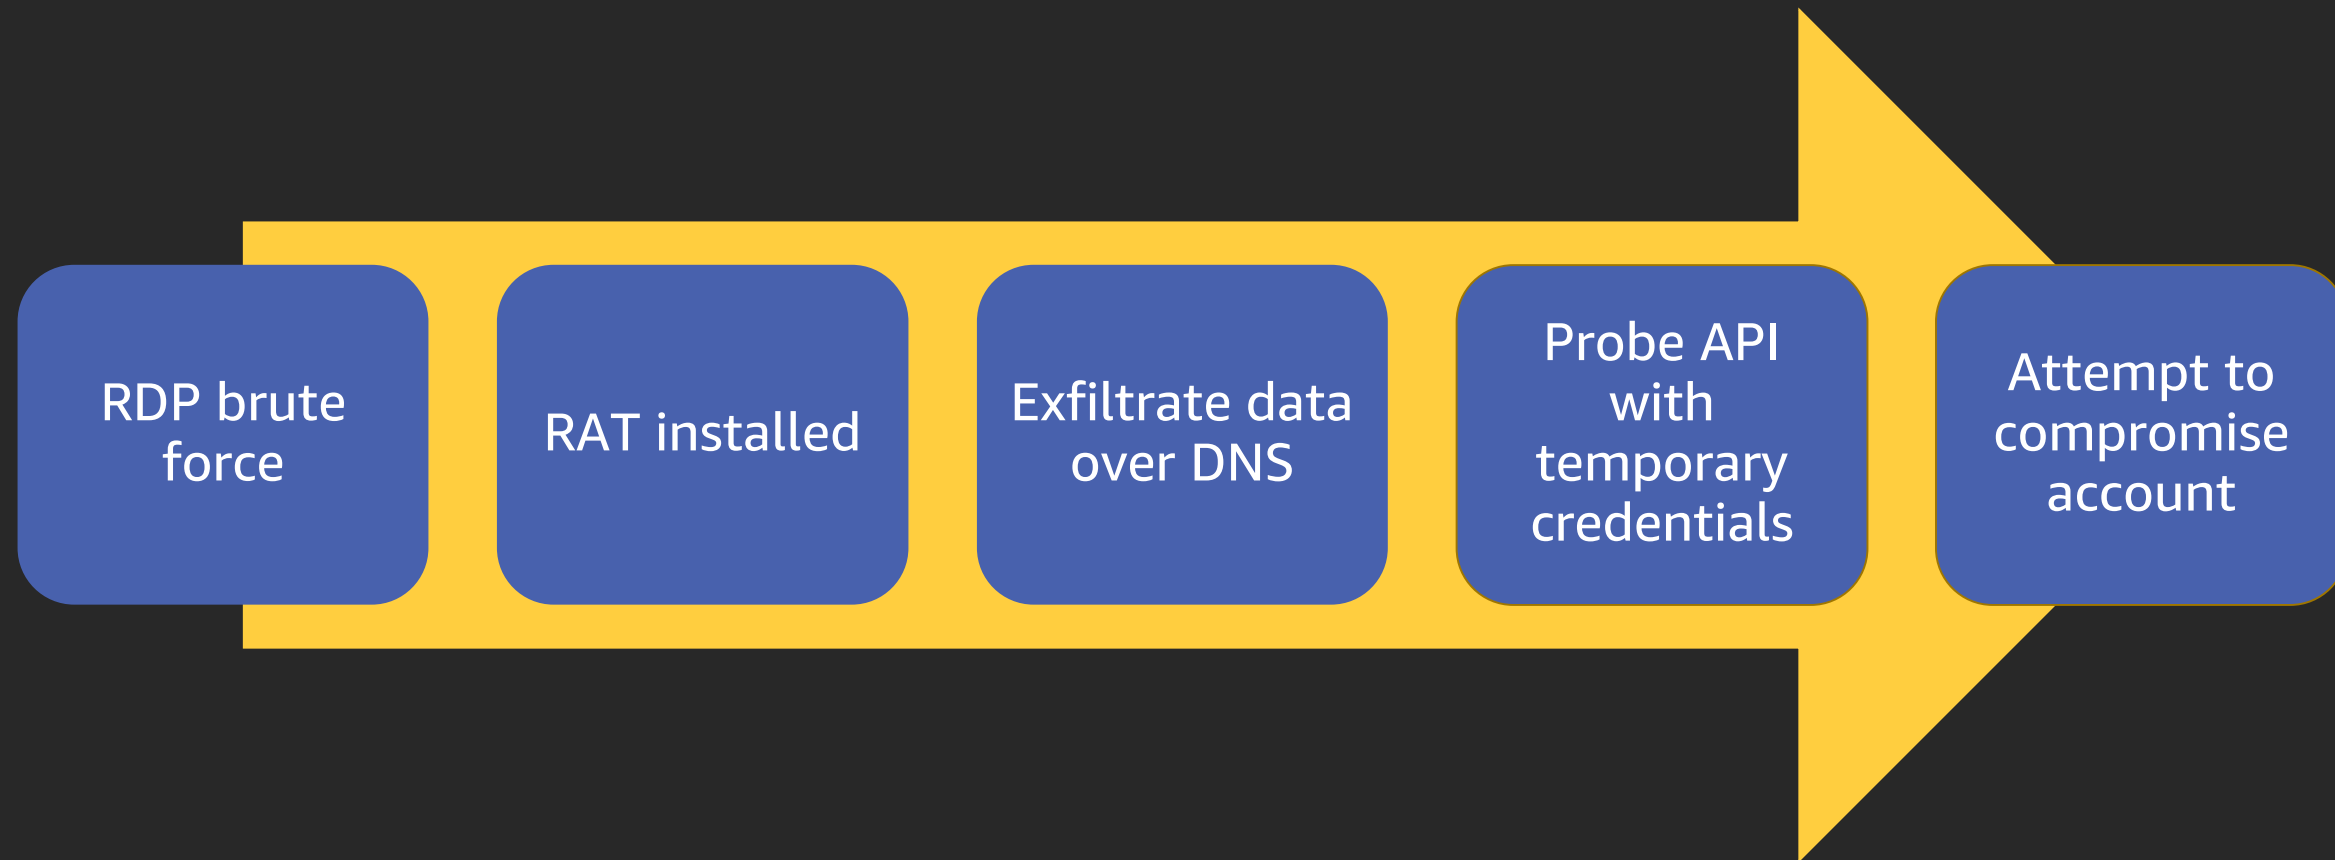

# Threat investigation: Amazon Detective

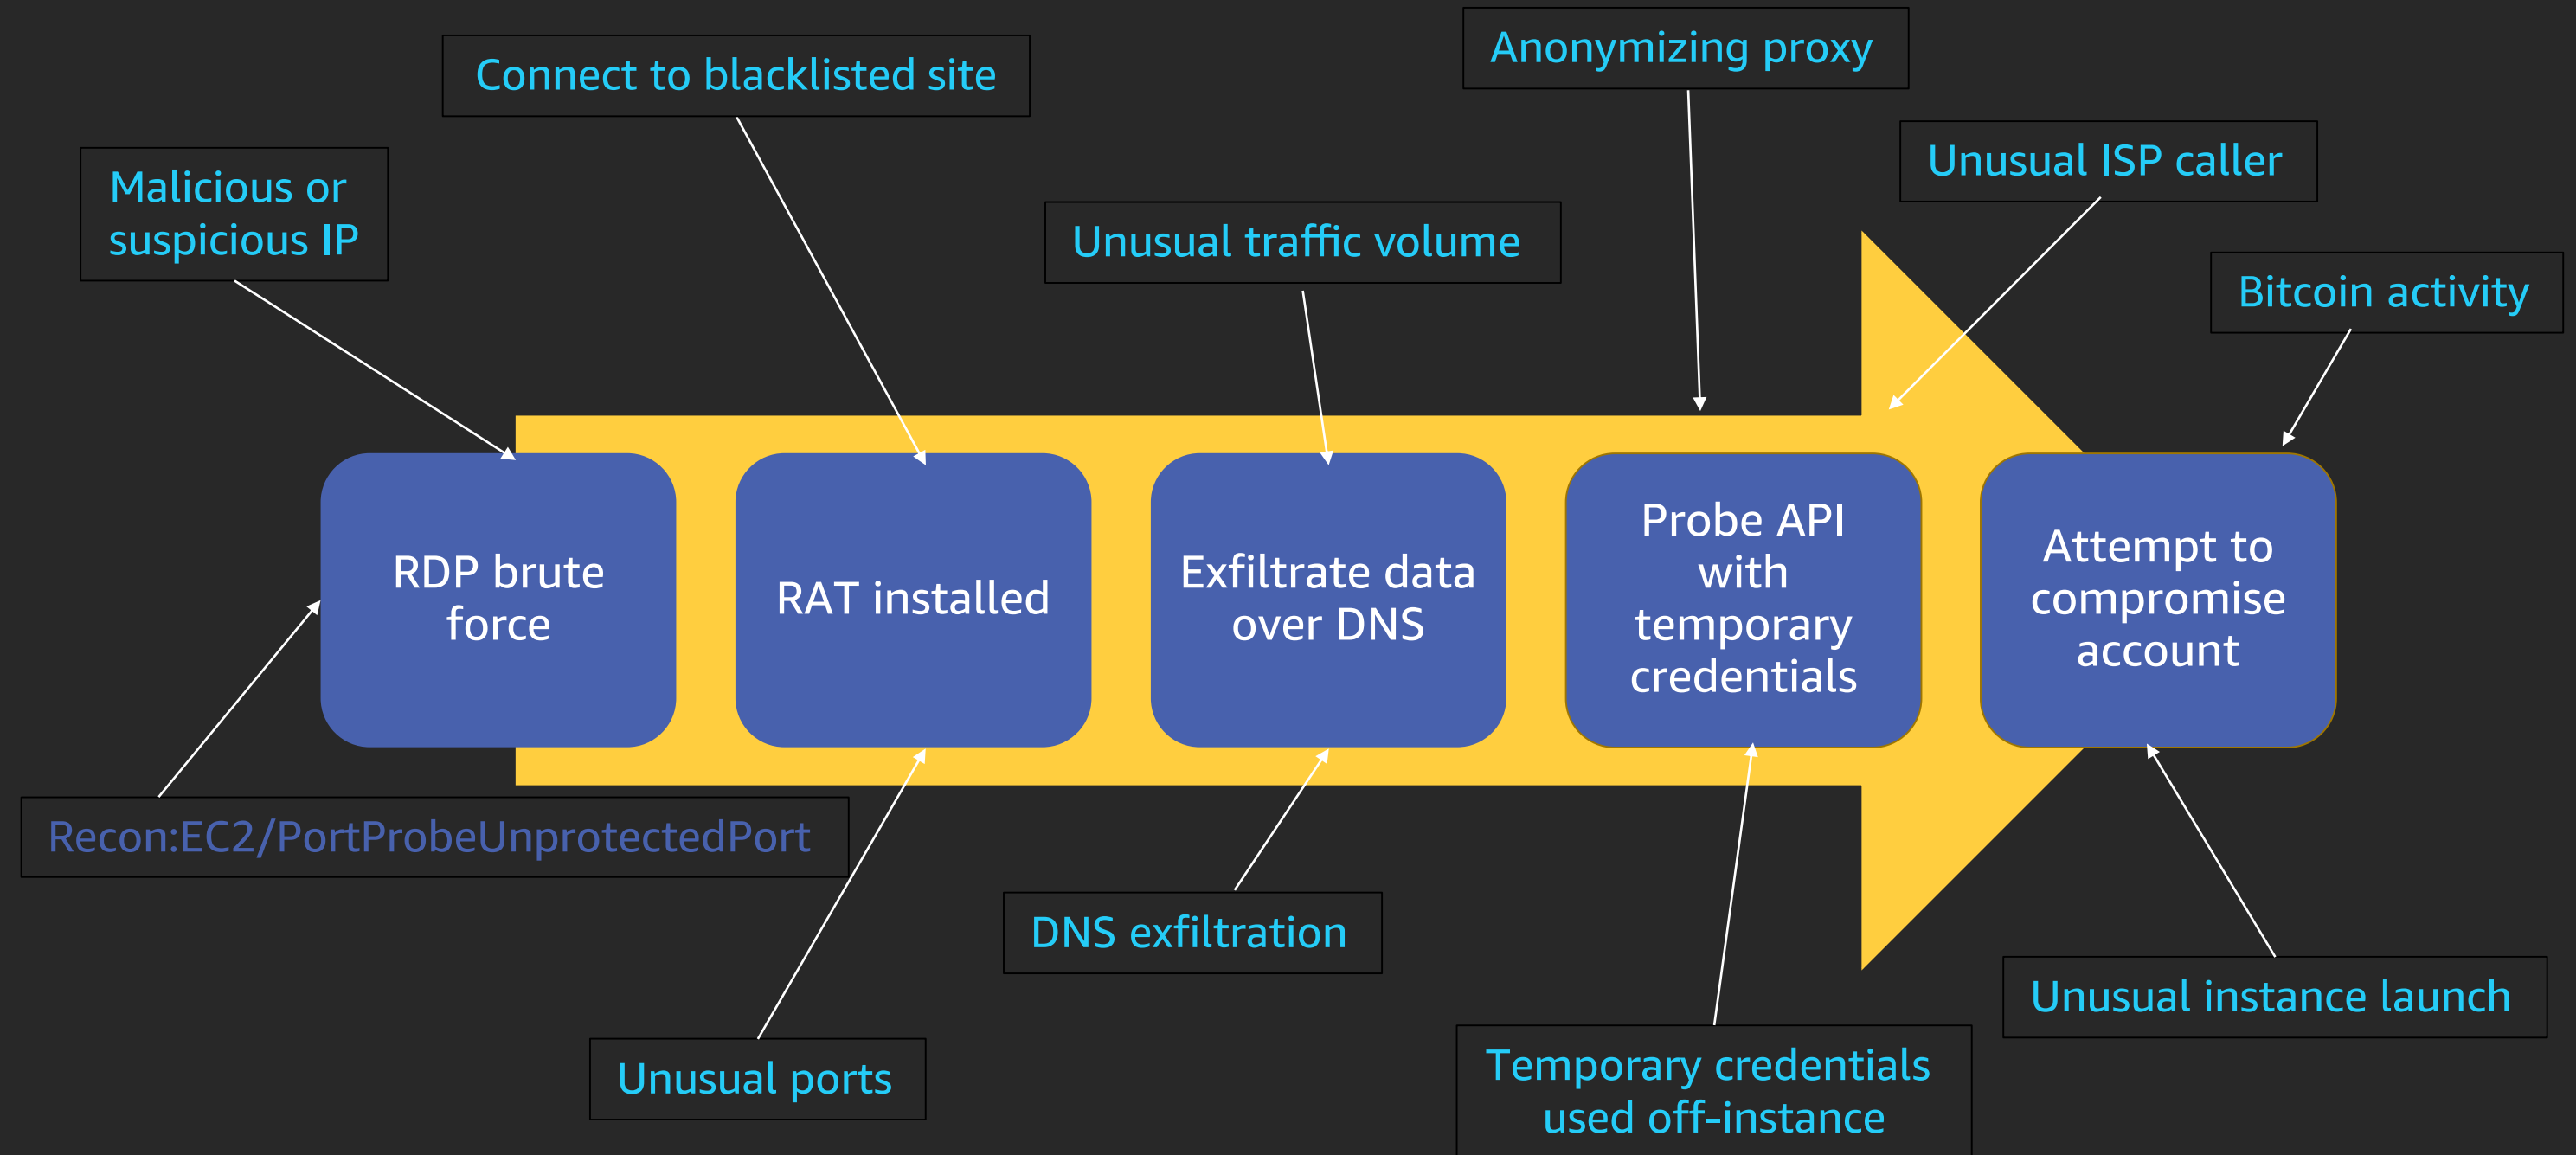

# Attacker lifecycle: Stages

# Attacker lifecycle: Attacker actions

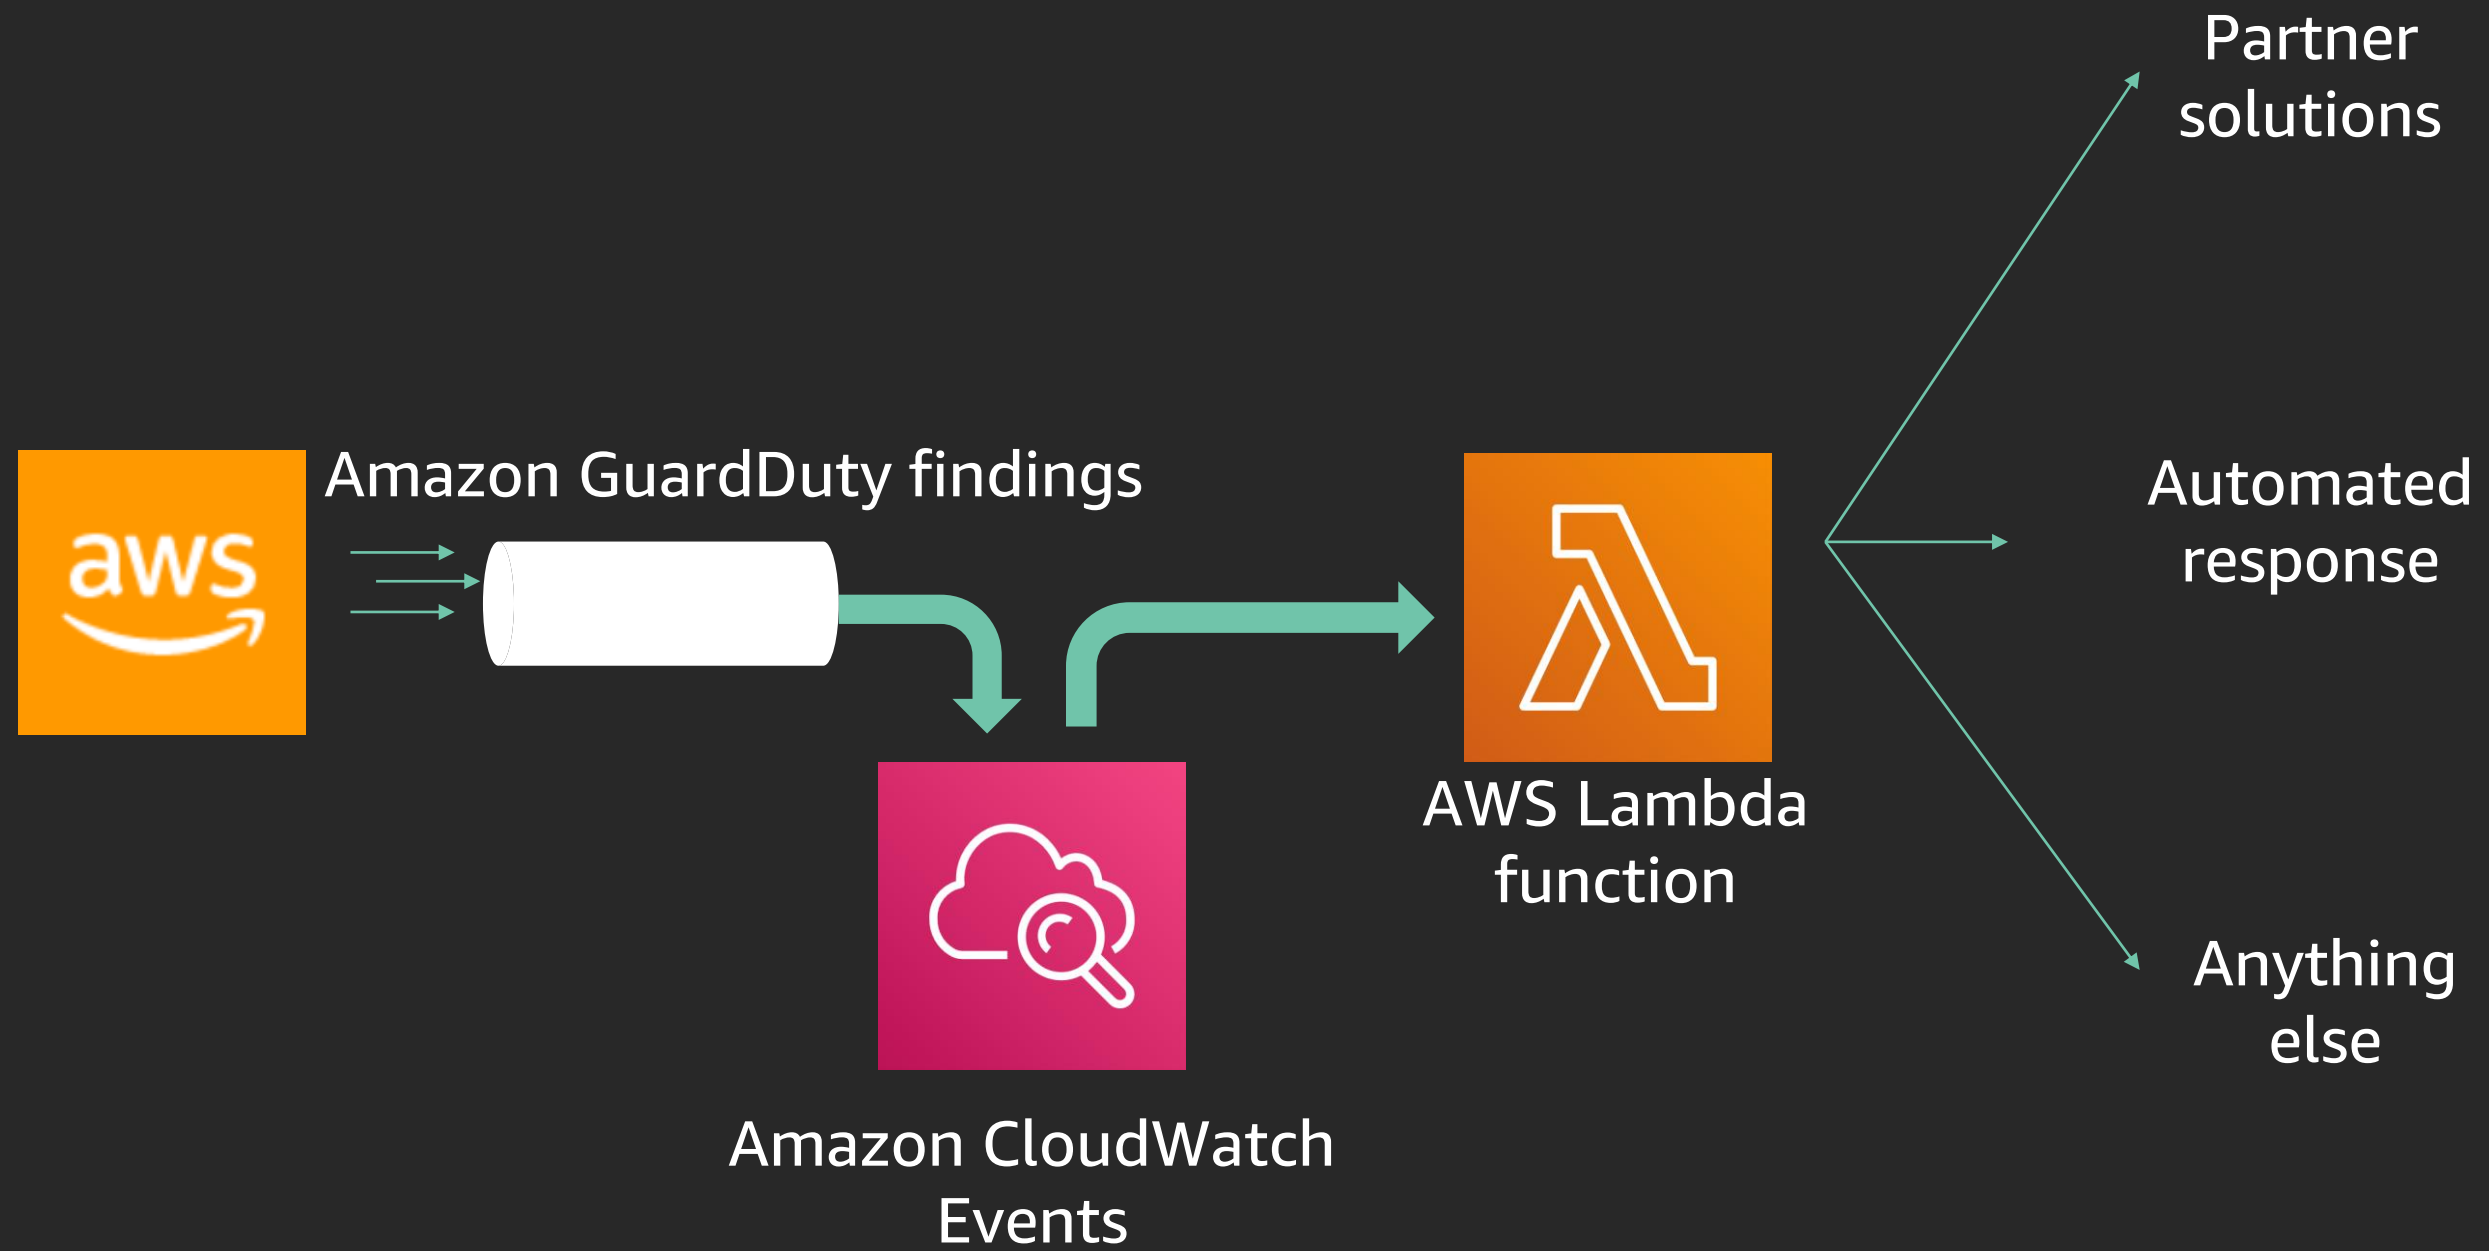

# Attacker lifecycle: Amazon GuardDuty findings

# Respond

# Threat response: Amazon CloudWatch Events

# Threat response: Services

## AWS Lambda

Run code for virtually any kind of application or backend service—zero administration

## AWS Systems Manager

Gain operational insights and take action on AWS resources

## Amazon Inspector

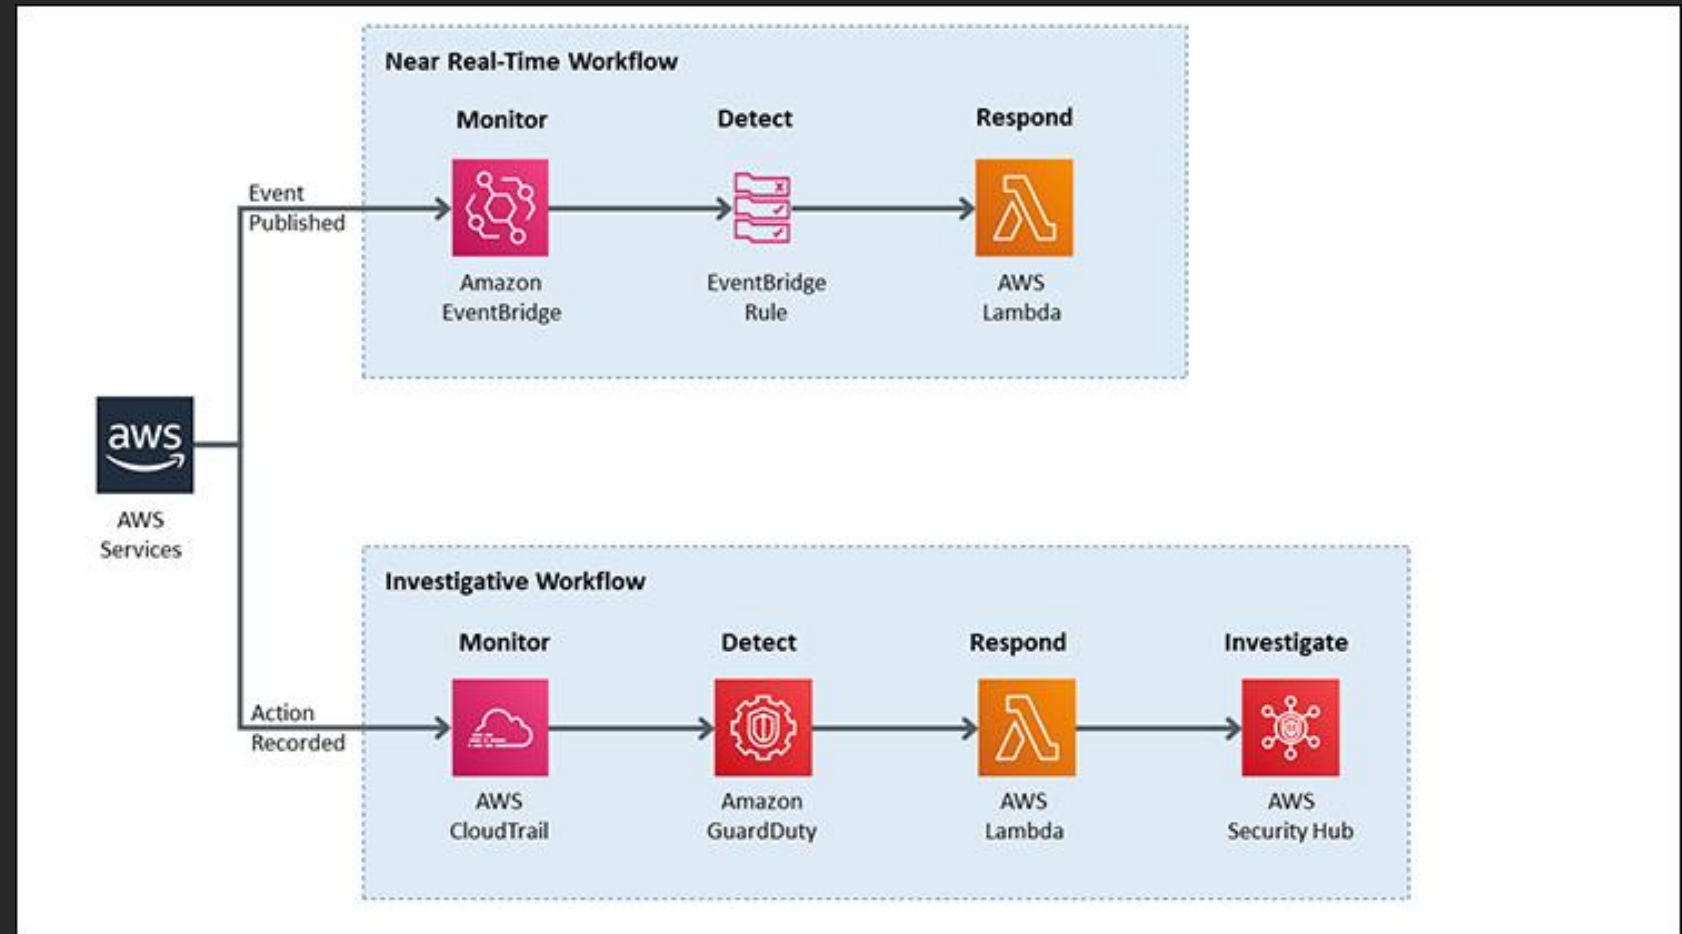

Automate security assessments of Amazon EC2 instances

# Security response automation on AWS

**Monitor:** Your automated monitoring tools collect information about resources and applications running in your AWS environment.

**Detect:** When a monitoring tool detects a predefined condition—such as a breached threshold, anomalous activity, or configuration deviation—it raises a flag within the system.

**Respond:** When a condition is flagged, an automated response is triggered that performs an action you've predefined—something intended to remediate or mitigate the flagged condition.

<https://aws.amazon.com/blogs/security/how-get-started-security-response-automation-aws/>

# Security response automation on AWS

**Monitor:** Collection of AWS CloudTrail information about activities performed in your AWS account, usage metrics from your Amazon EC2 instances, or flow log information about the traffic going to and from network interfaces in your Amazon Virtual Private Cloud (VPC).

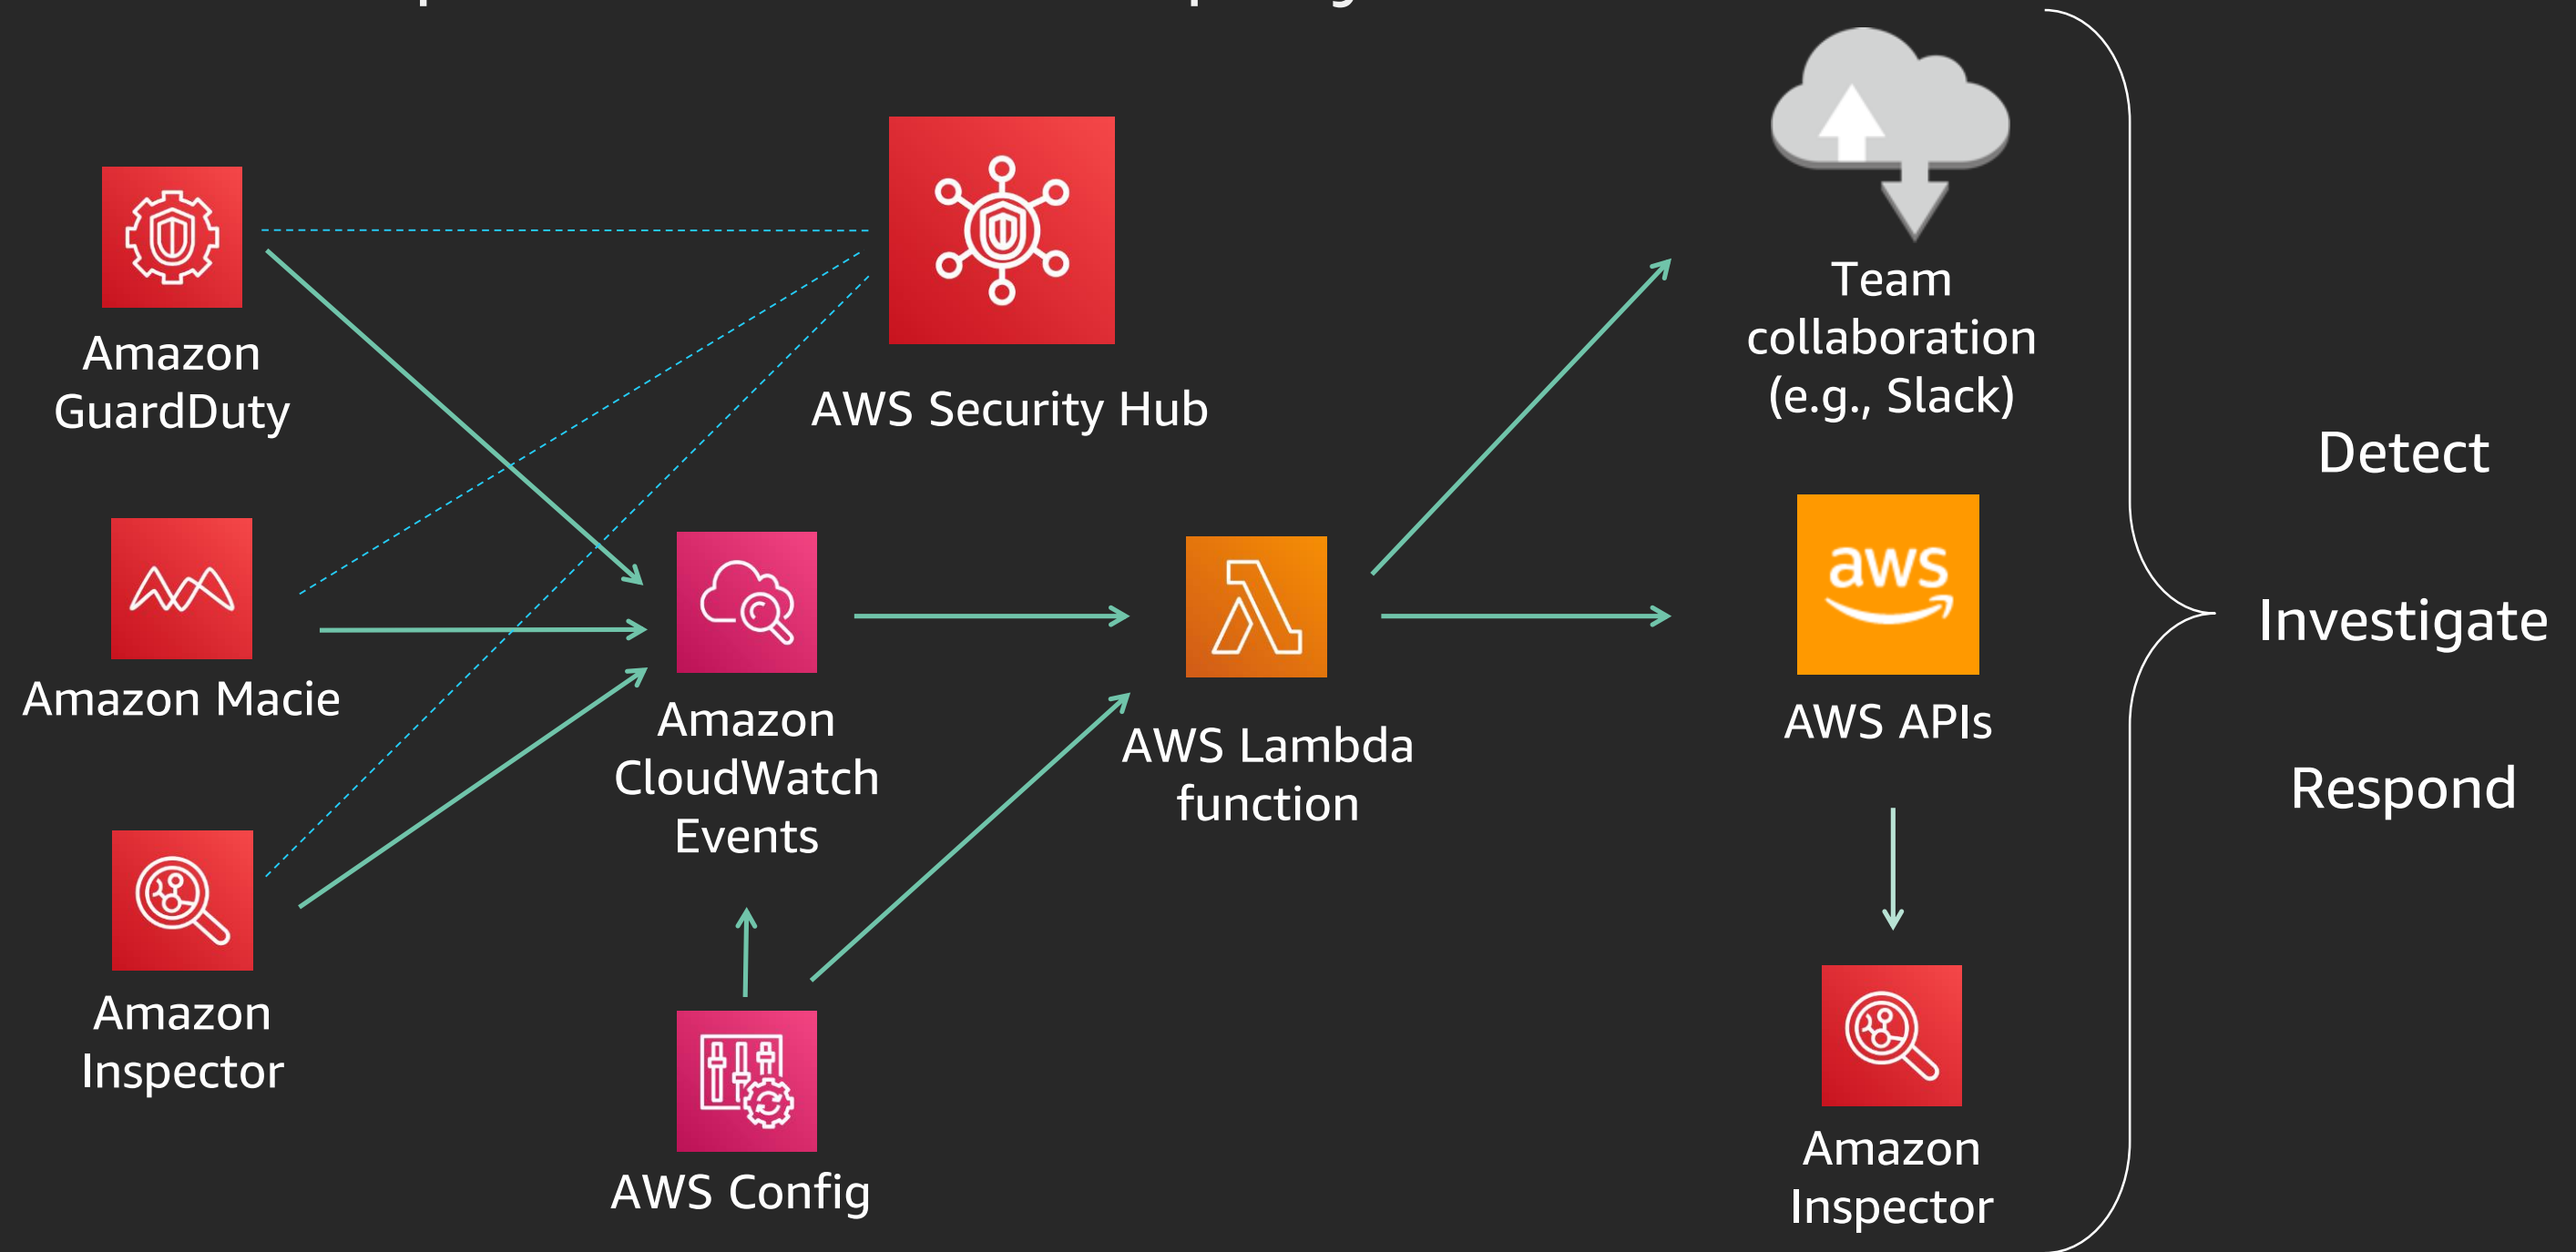

**Detect:** A triggering condition might be an anomalous activity detected by Amazon GuardDuty, a resource becoming out of compliance with an AWS Config Rule, or a high rate of blocked requests on an Amazon VPC security group or AWS WAF web access control list.

**Respond:** Examples of automated response actions might include modifying a VPC security group, patching an Amazon EC2 instance, or rotating credentials.

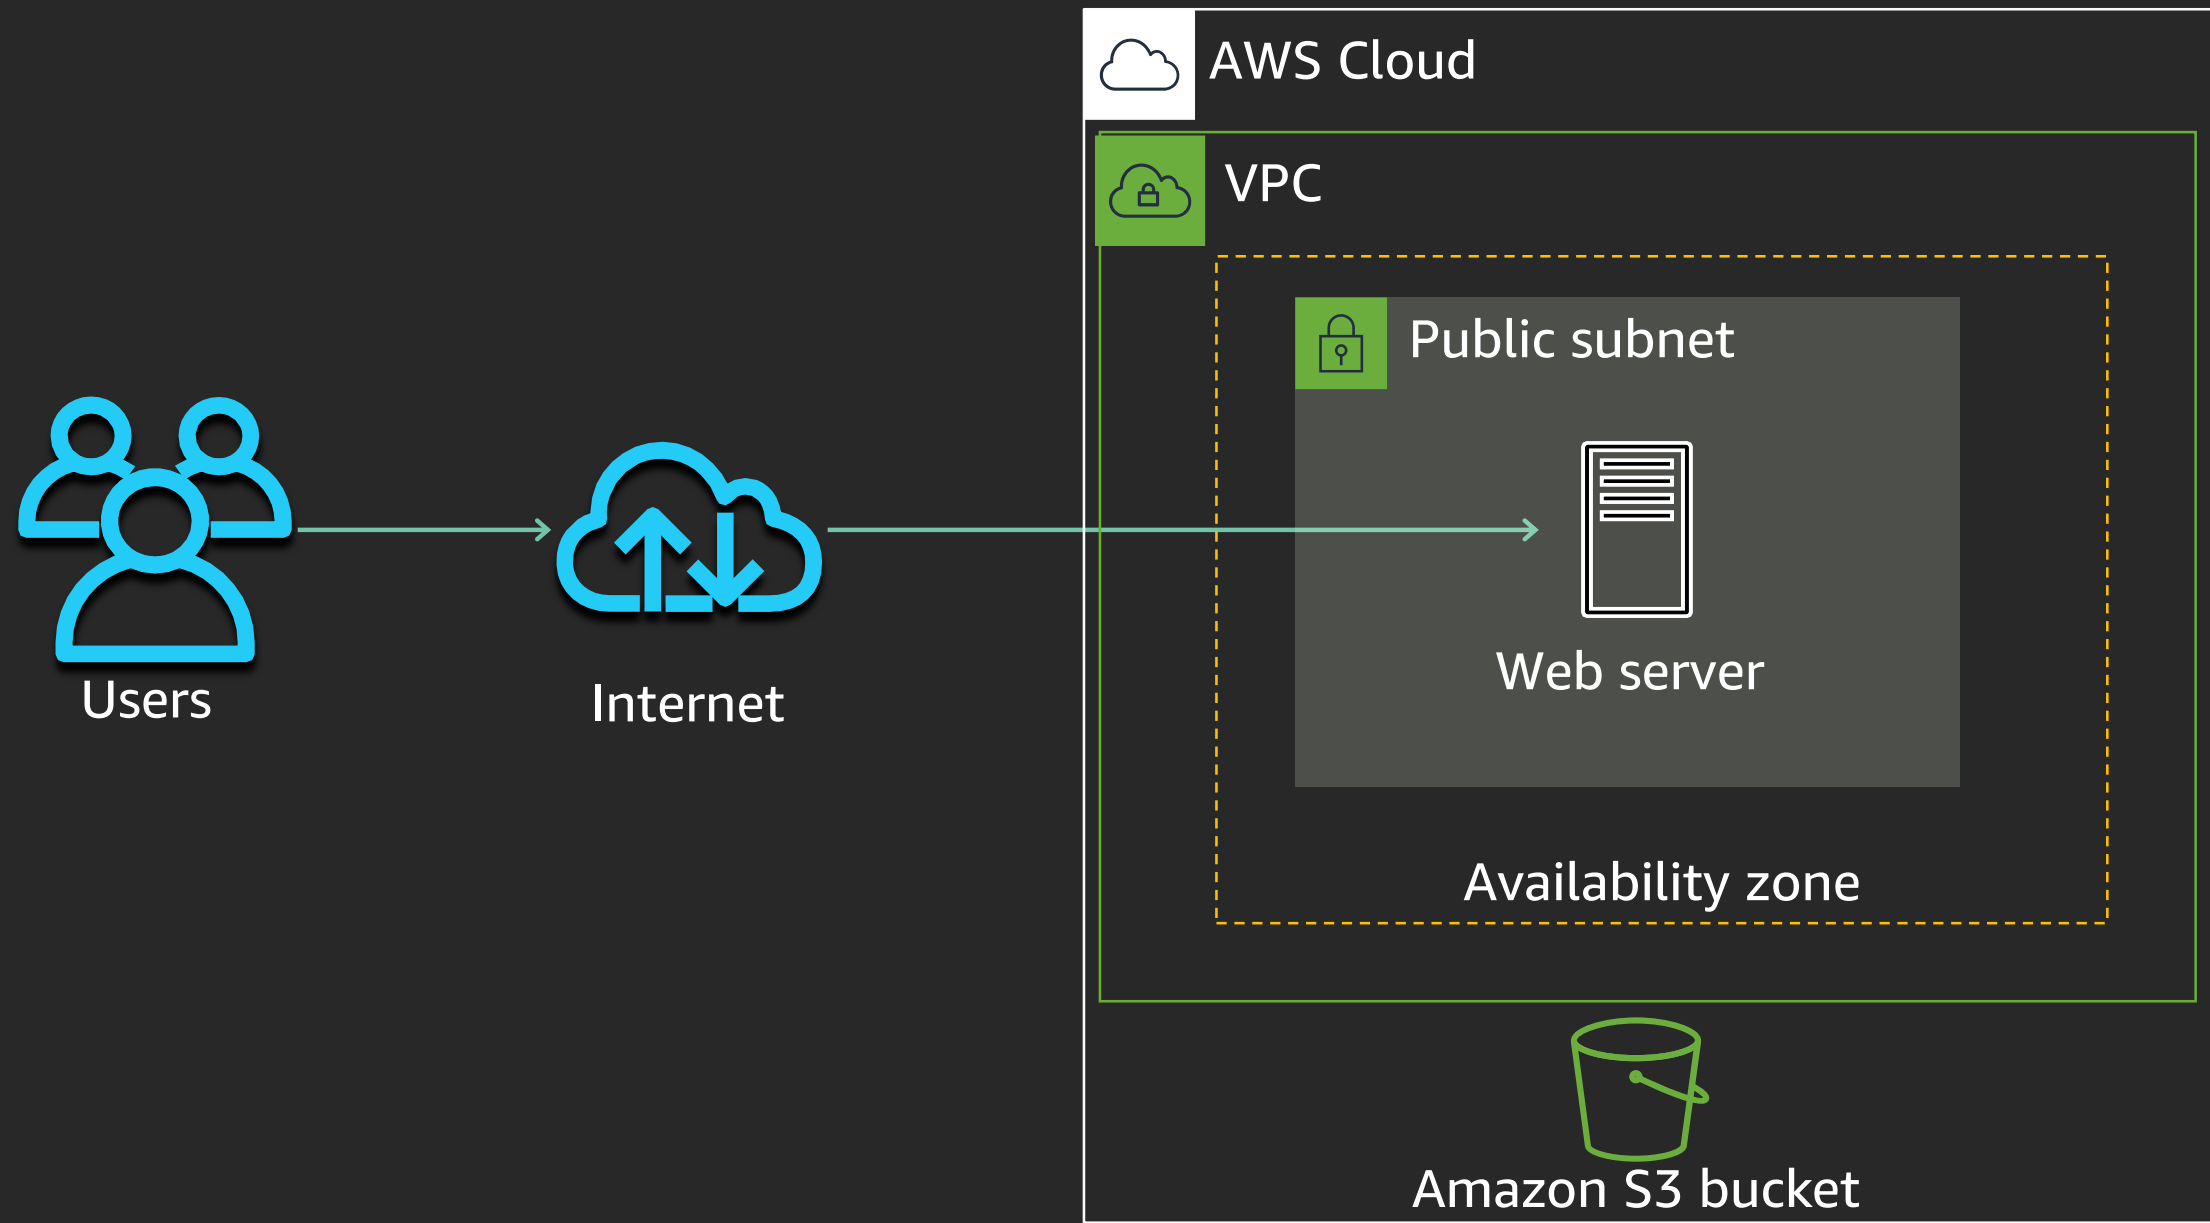

<https://aws.amazon.com/blogs/security/how-get-started-security-response-automation-aws/>

# Threat response: Detailed playbook

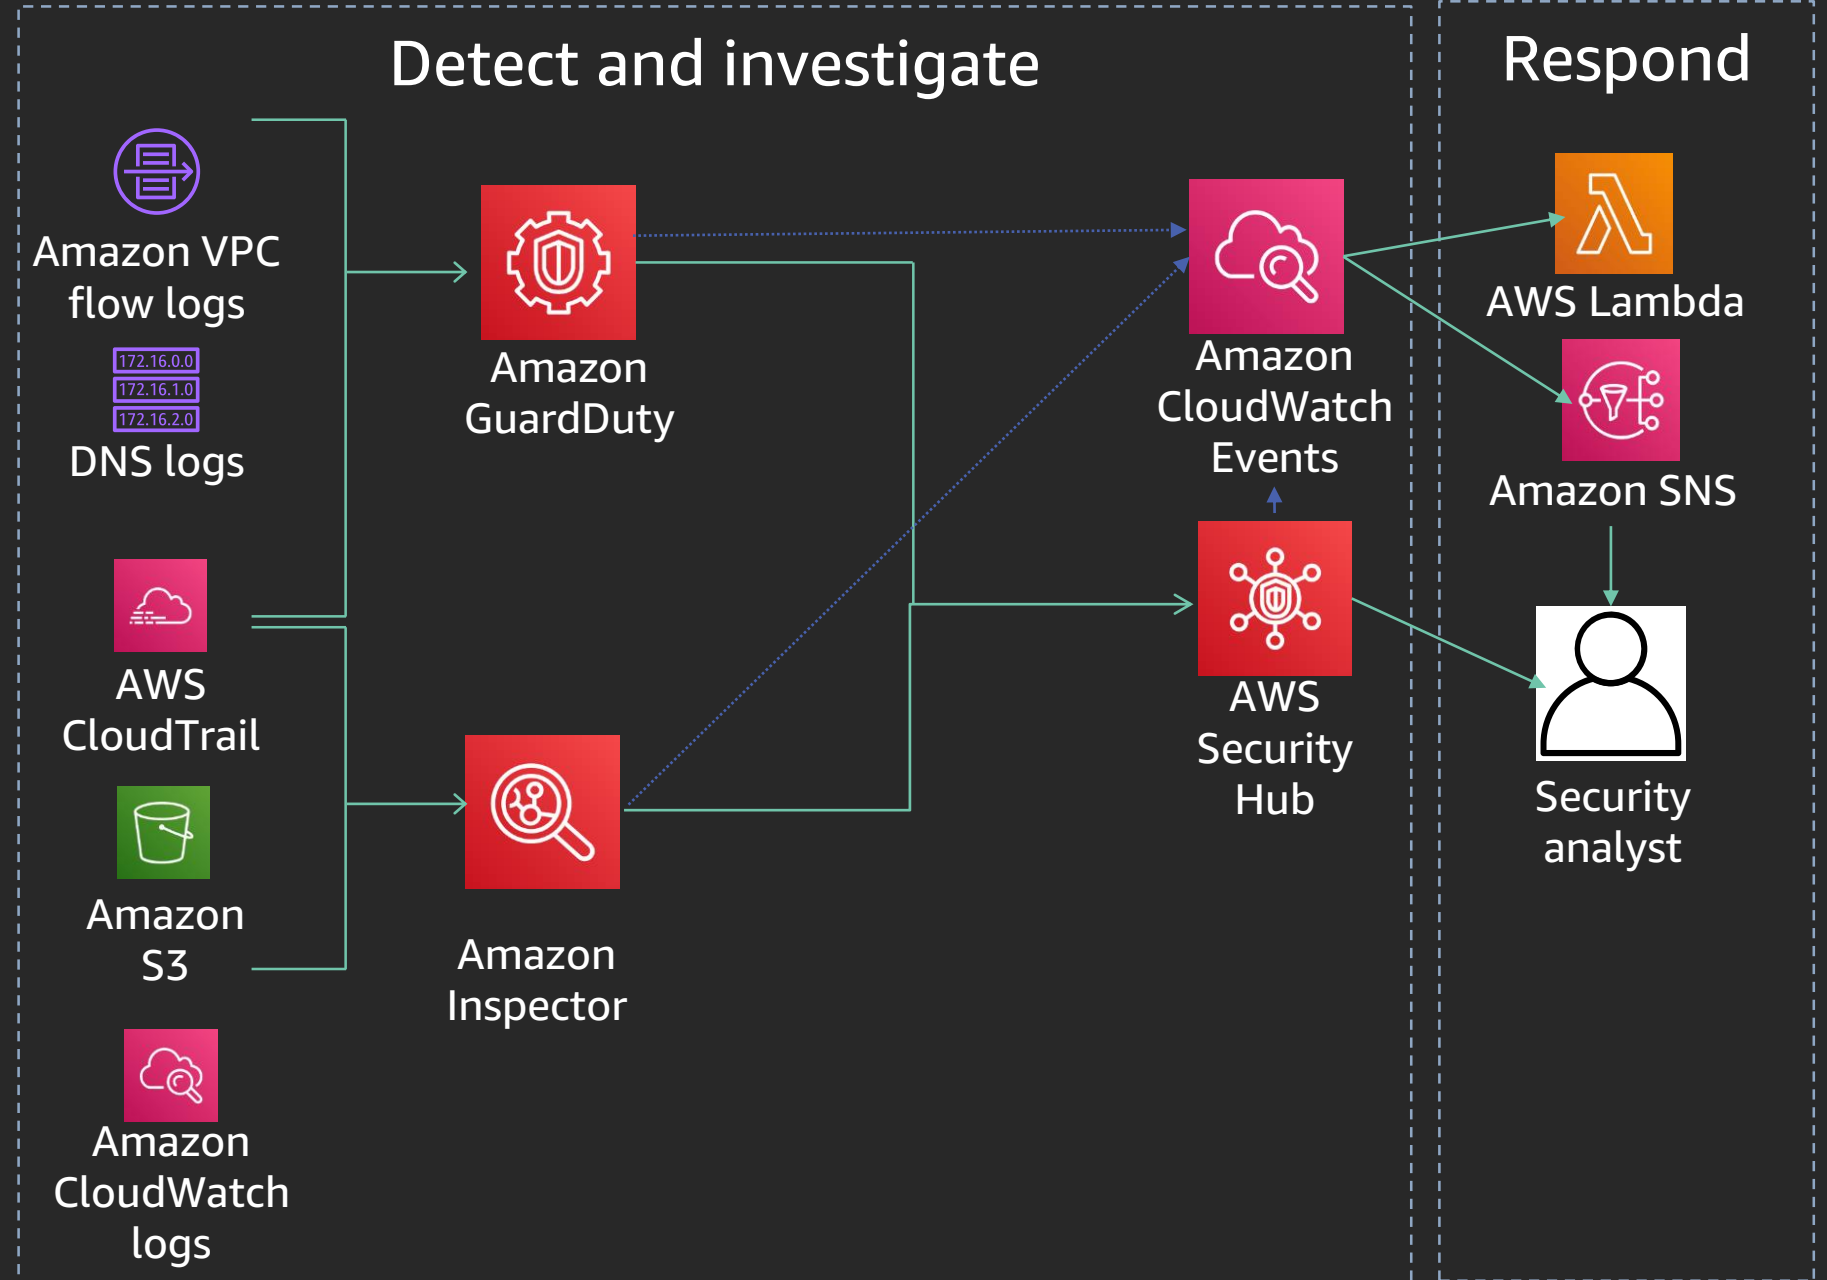

# Workshop walk-through: What happened?

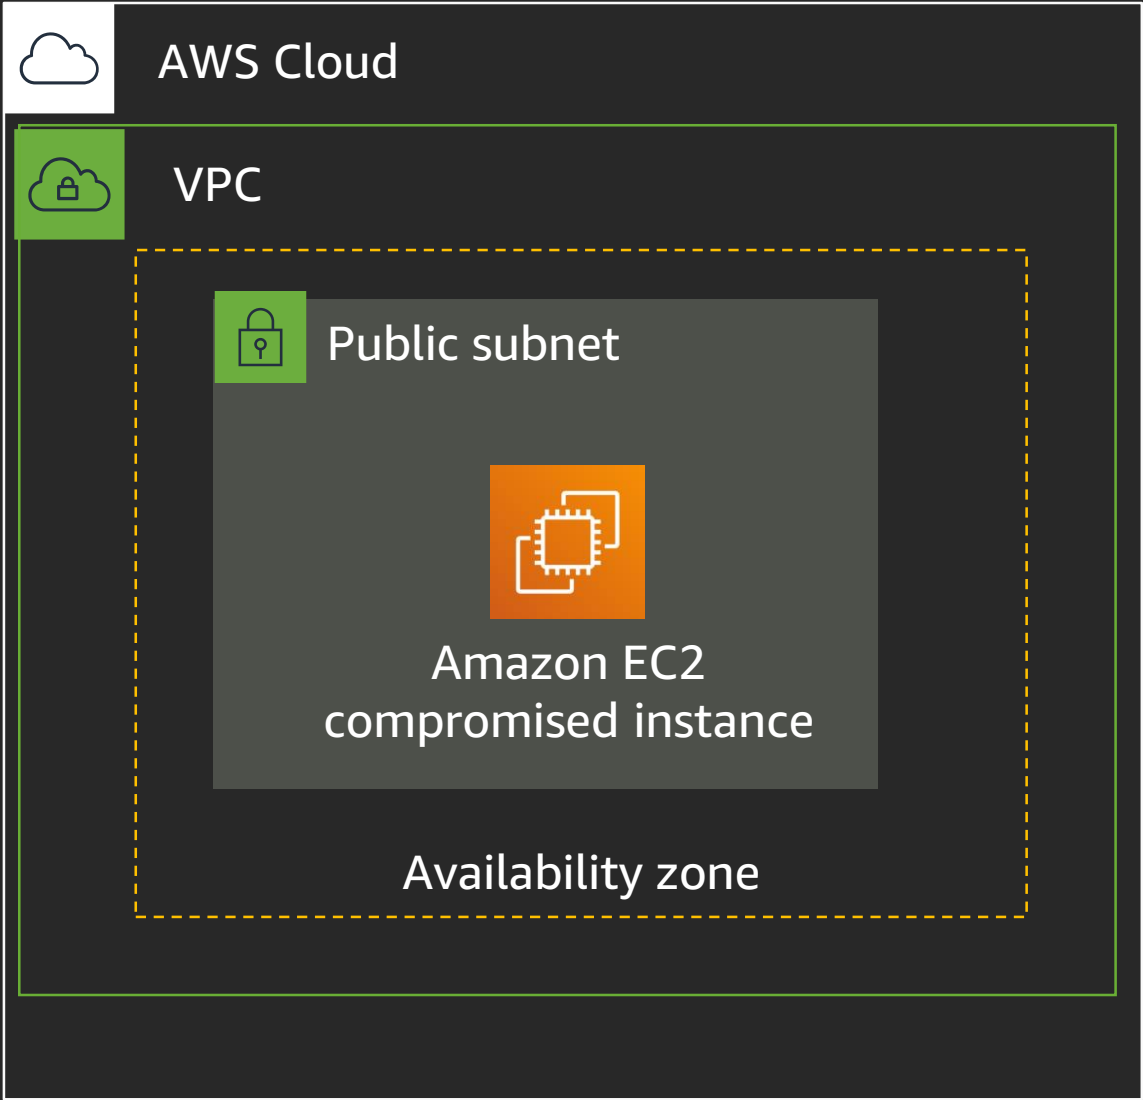

# Module 2: Attack target

# Module 2: Setup

# Module 2: The attack

# Module 3: Detect and response

Use US West (Oregon)  
us-west-2

<https://dashboard.eventengine.run>

<https://automating-threat-detection.awssecworkshops.com/>

## Directions

1. Browse to the URL
2. Choose **Module 3: Detect & Respond** in the outline on the left
3. Run through the module (~45 min.)

# Review, questions, and lessons learned

# Module 4: What happened?

- Review (5 min.)
- Questions (10 min.)
- Lessons learned (5 min.)

# Module 4: What happened?

Use US West (Oregon)  
us-west-2

<https://automating-threat-detection.awssecworkshops.com/>

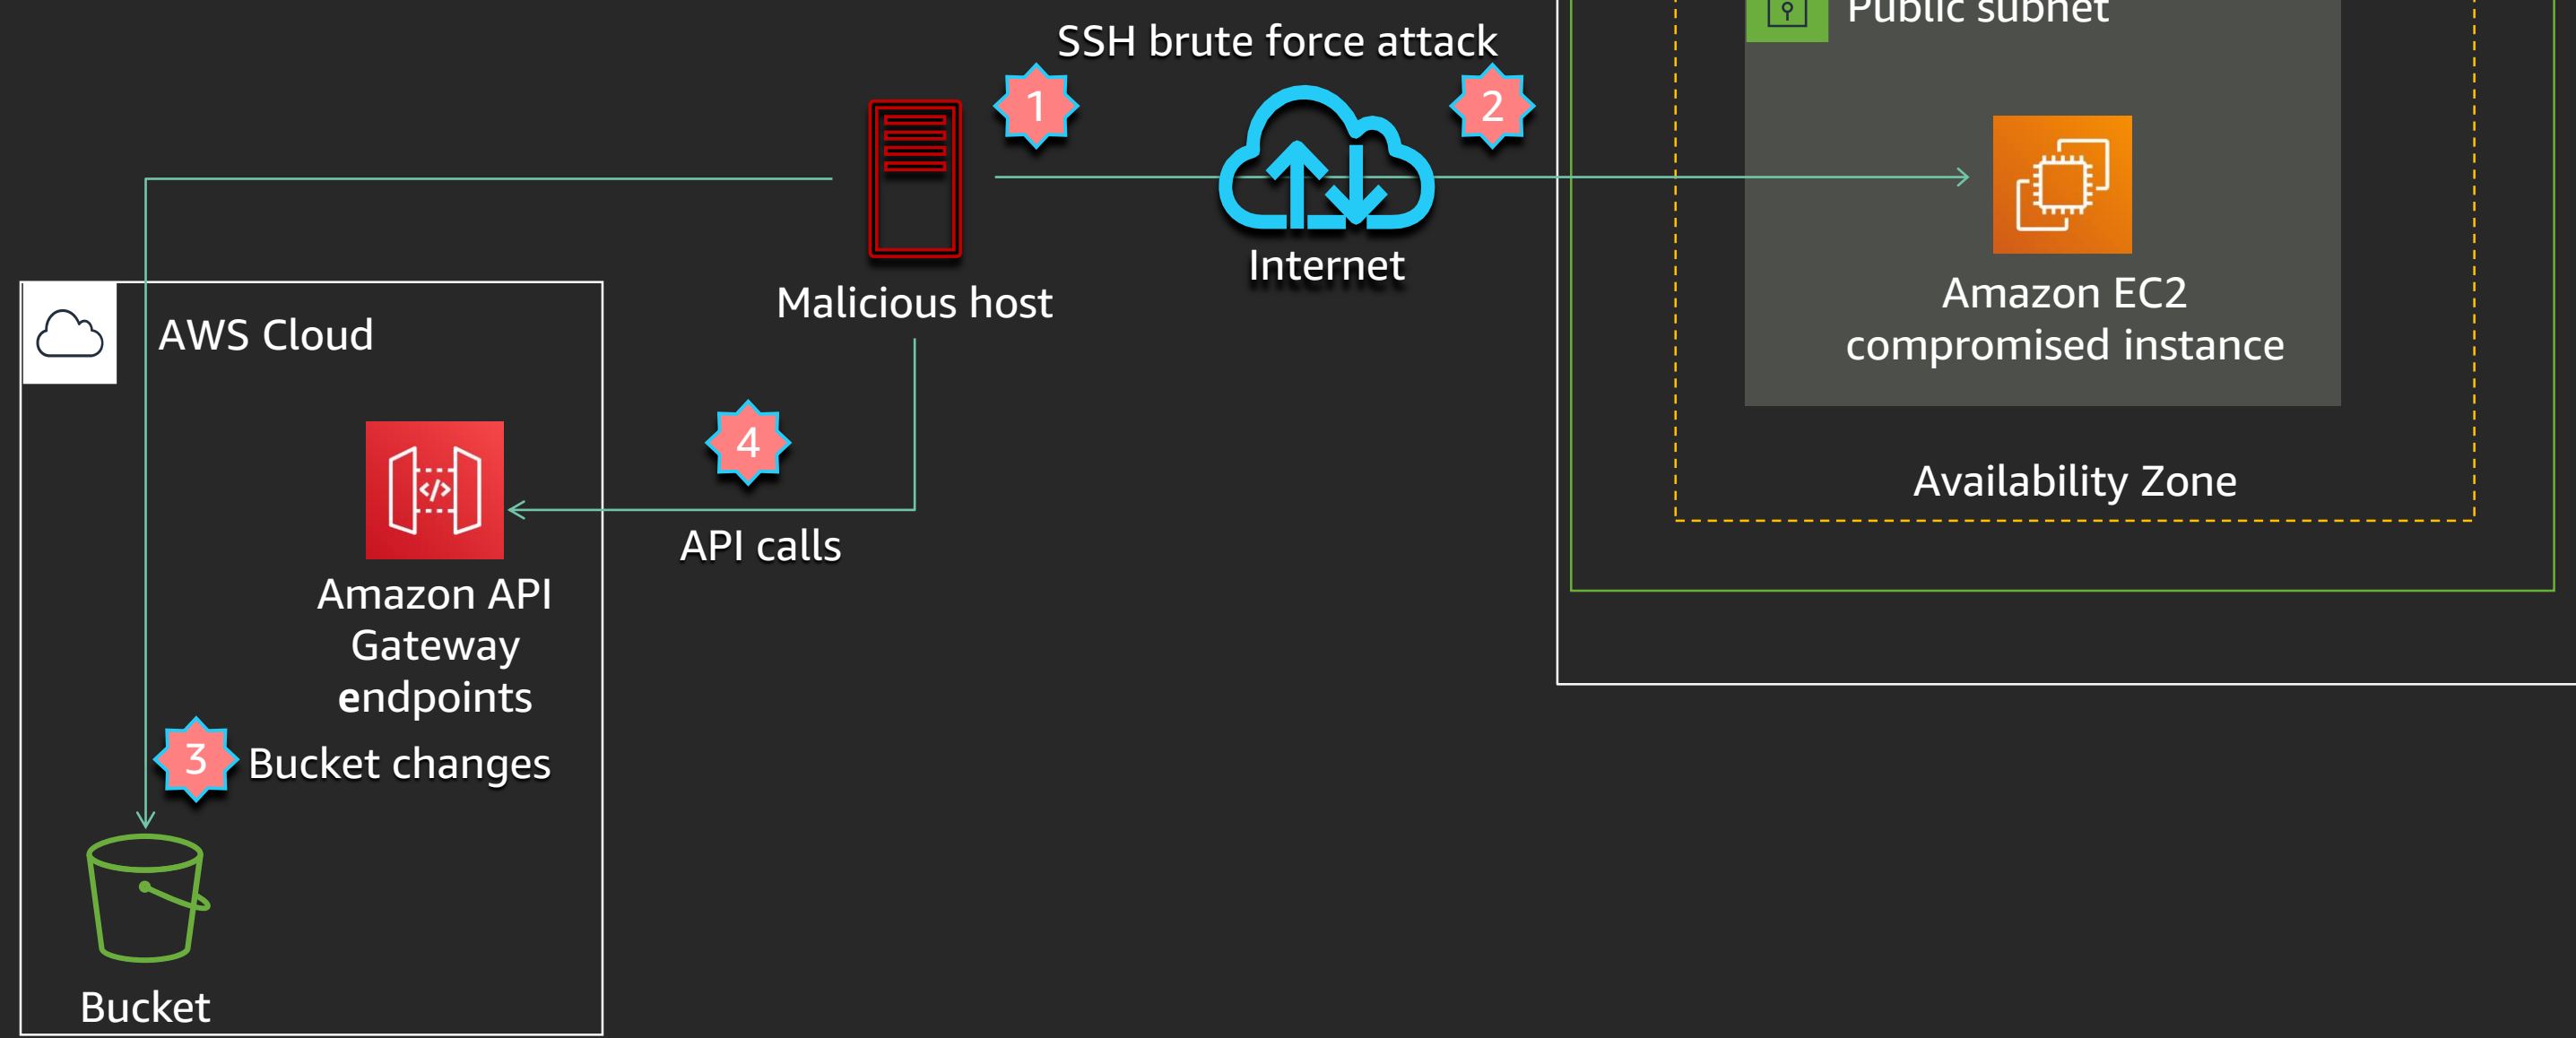

## Directions

1. Browse to the URL
2. Choose **Module 4: Discussion** in the outline on the left
3. We will summarize the workshop, then answer questions
4. Do not need to do – Account lessons learned instructions

Don't leave – Hands on with Amazon Detective is very soon.

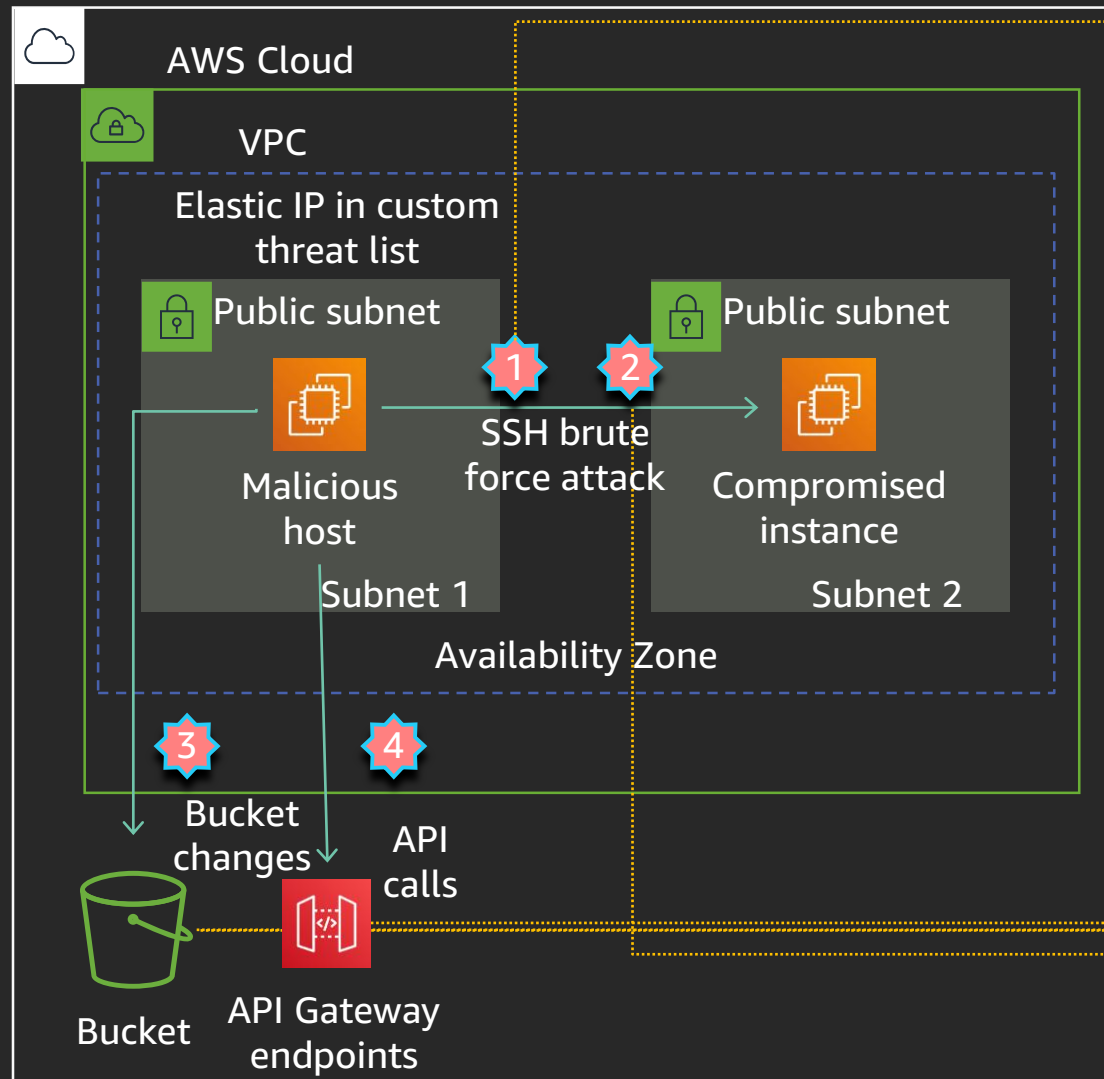

# Scenario discussion

# Module 4: The attack

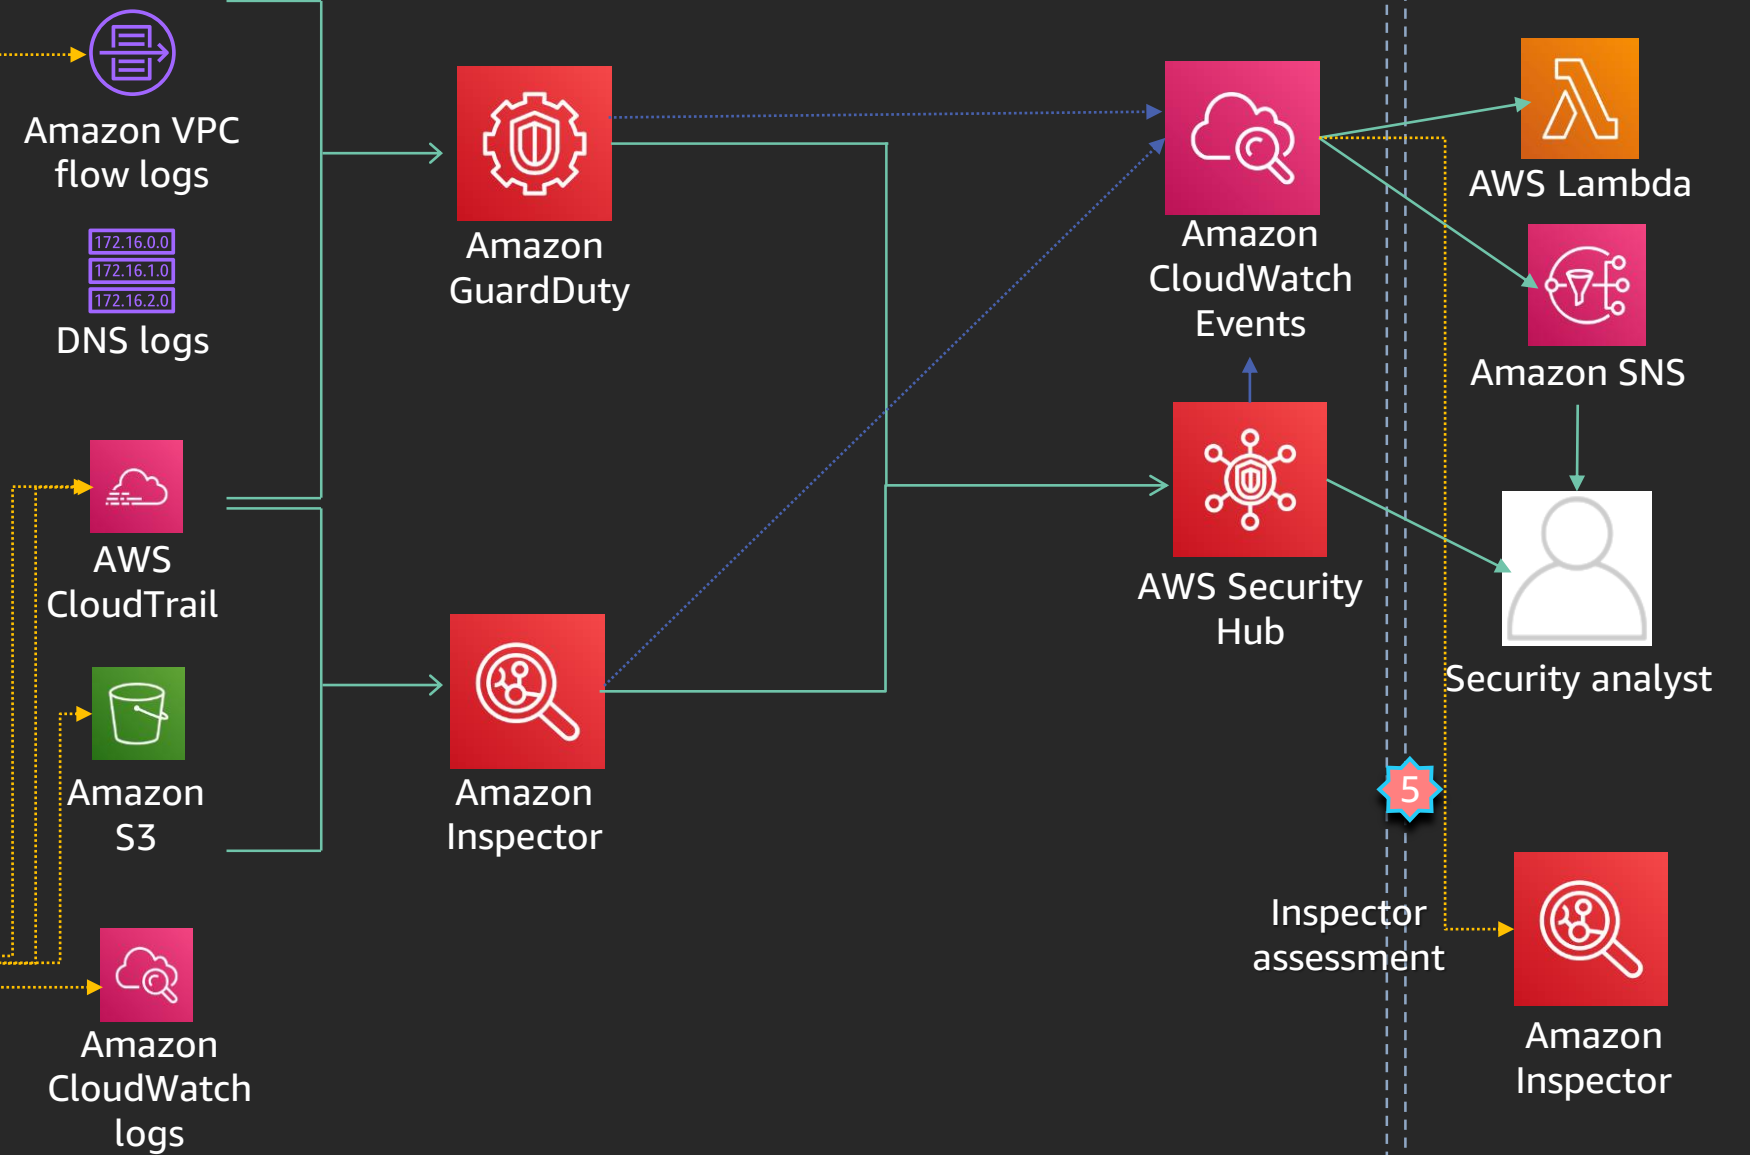

# Module 4: What really happened?

## The attack

## Detect and investigate

# Questions

# Workshop questions 1

Which of the following AWS services have direct access to your Amazon EC2 instances?

What performance impact does Amazon GuardDuty have on your account if you have more than 100 VPCs?

How do you kick off notifications or actions based on events in Amazon GuardDuty?

# Workshop questions 2

The lab mentions that you can ignore the high-severity SSH brute force attack finding; why?

Why did the API calls from the malicious host generate Amazon GuardDuty findings?

What is required for Amazon CloudWatch logs to capture evidence to help investigate an SSH brute force attack?

What key remediation step was missed regarding the SSH brute force attack?

# Lessons learned from incident response

## Use a strong tagging strategy.

### Technical Tags

**Name** – Used to identify individual resources

**Application ID** – Used to identify disparate resources that are related to a specific application

**Application Role** – Used to describe the function of a particular resource (e.g. web server, message broker, database)

**Cluster** – Used to identify resource farms that share a common configuration and perform a specific function for an application

**Environment** – Used to distinguish between development, test, and production infrastructure

**Version** – Used to help distinguish between different versions of resources or applications

### Tags for Automation

**Date/Time** – Used to identify the date or time a resource should be started, stopped, deleted, or rotated

**Opt in/Opt out** – Used to indicate whether a resource should be automatically included in an automated activity such as starting, stopping, or resizing instances

**Security** – Used to determine requirements such as encryption or enabling of VPC Flow Logs, and also to identify route tables or security groups that deserve extra scrutiny

### Business Tags

**Owner** – Used to identify who is responsible for the resource

**Cost Center/Business Unit** – Used to identify the cost center or business unit associated with a resource; typically for cost allocation and tracking

**Customer** – Used to identify a specific client that a particular group of resources serves

**Project** – Used to identify the project(s) the resource supports

### Security Tags

**Confidentiality** – An identifier for the specific data-confidentiality level a resource supports

**Compliance** – An identifier for workloads designed to adhere to specific compliance requirements

<https://aws.amazon.com/answers/account-management/aws-tagging-strategies/>

<https://aws.amazon.com/blogs/aws/new-use-tag-policies-to-manage-tags-across-multiple-aws-accounts/>

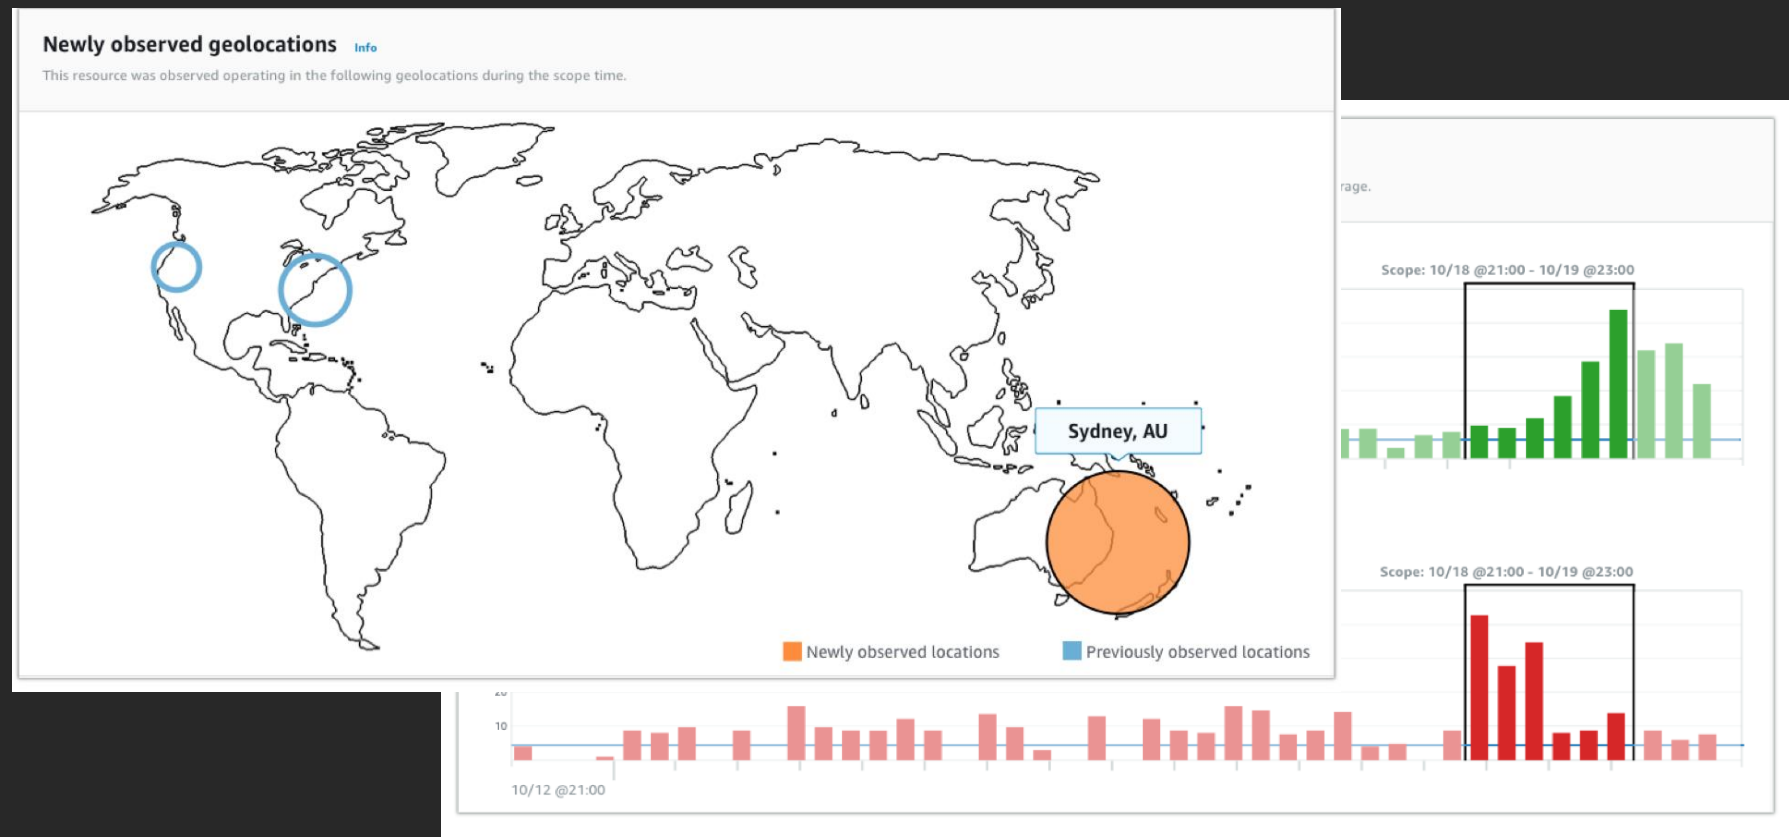

# Lessons learned from incident response

- Questions to ask during the investigation
  - Is this finding a true positive?
  - is the event an unusual activity or more?
  - Where did the incident occur?
  - Who reported or discovered the incident?
  - How was it discovered?
  - Are there any other areas that have been compromised by the incident? If so, what are they and when were they discovered?
  - What is the scope of the impact?
  - What is the business impact?
  - Have the source(s) of the incident been located? If so, where, when, and what are they?

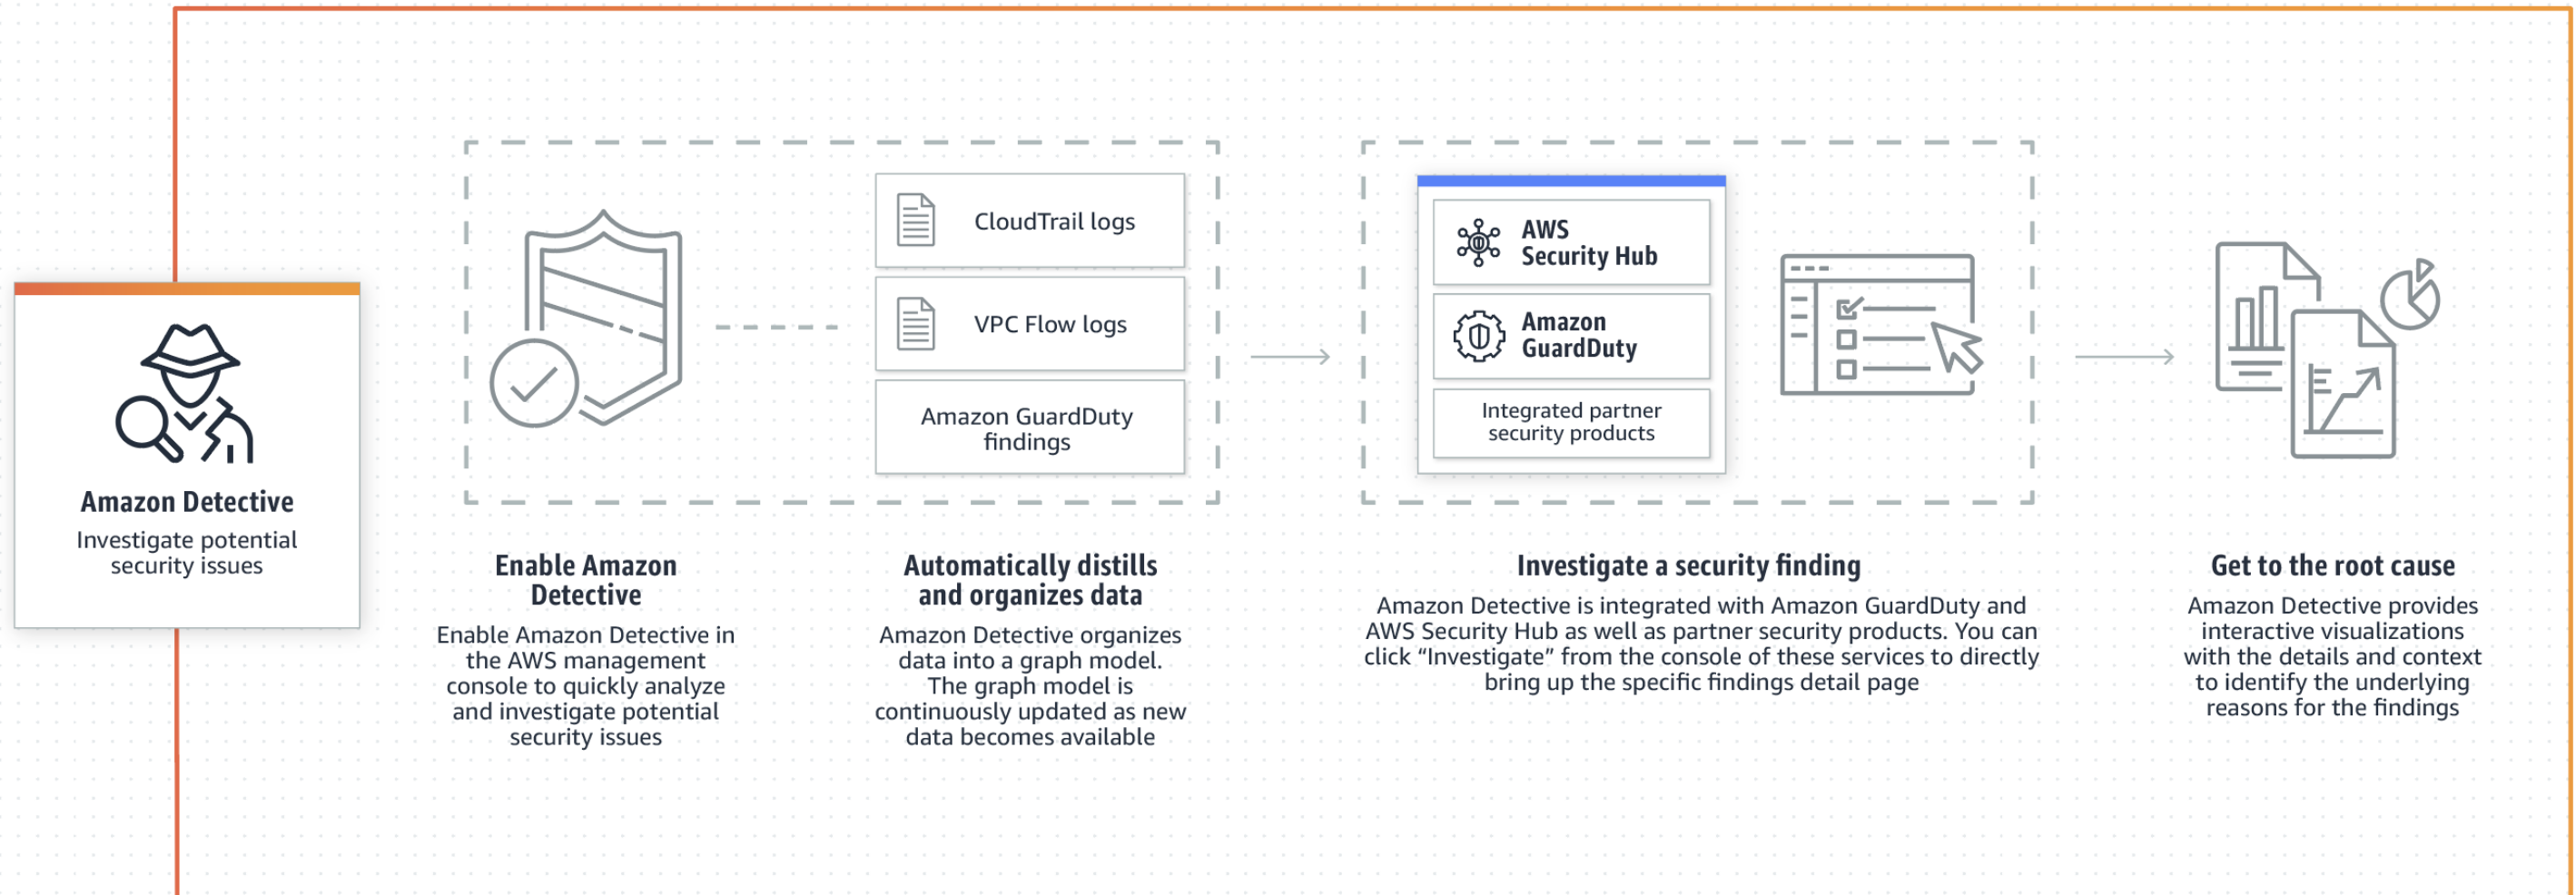

# Amazon Detective

# Introducing Amazon Detective (Preview)

Analyze and visualize security data to rapidly get to the root cause of potential security issues

# How Amazon Detective works?

# Pivot from GuardDuty, Security Hub and other consoles

# Hands on with Amazon Detective

# Module 5: re:Invent 2019

Use US West (Oregon)  
us-west-2

<https://dashboard.eventengine.run>

<https://automating-threat-detection.awssecworkshops.com/>

## Directions

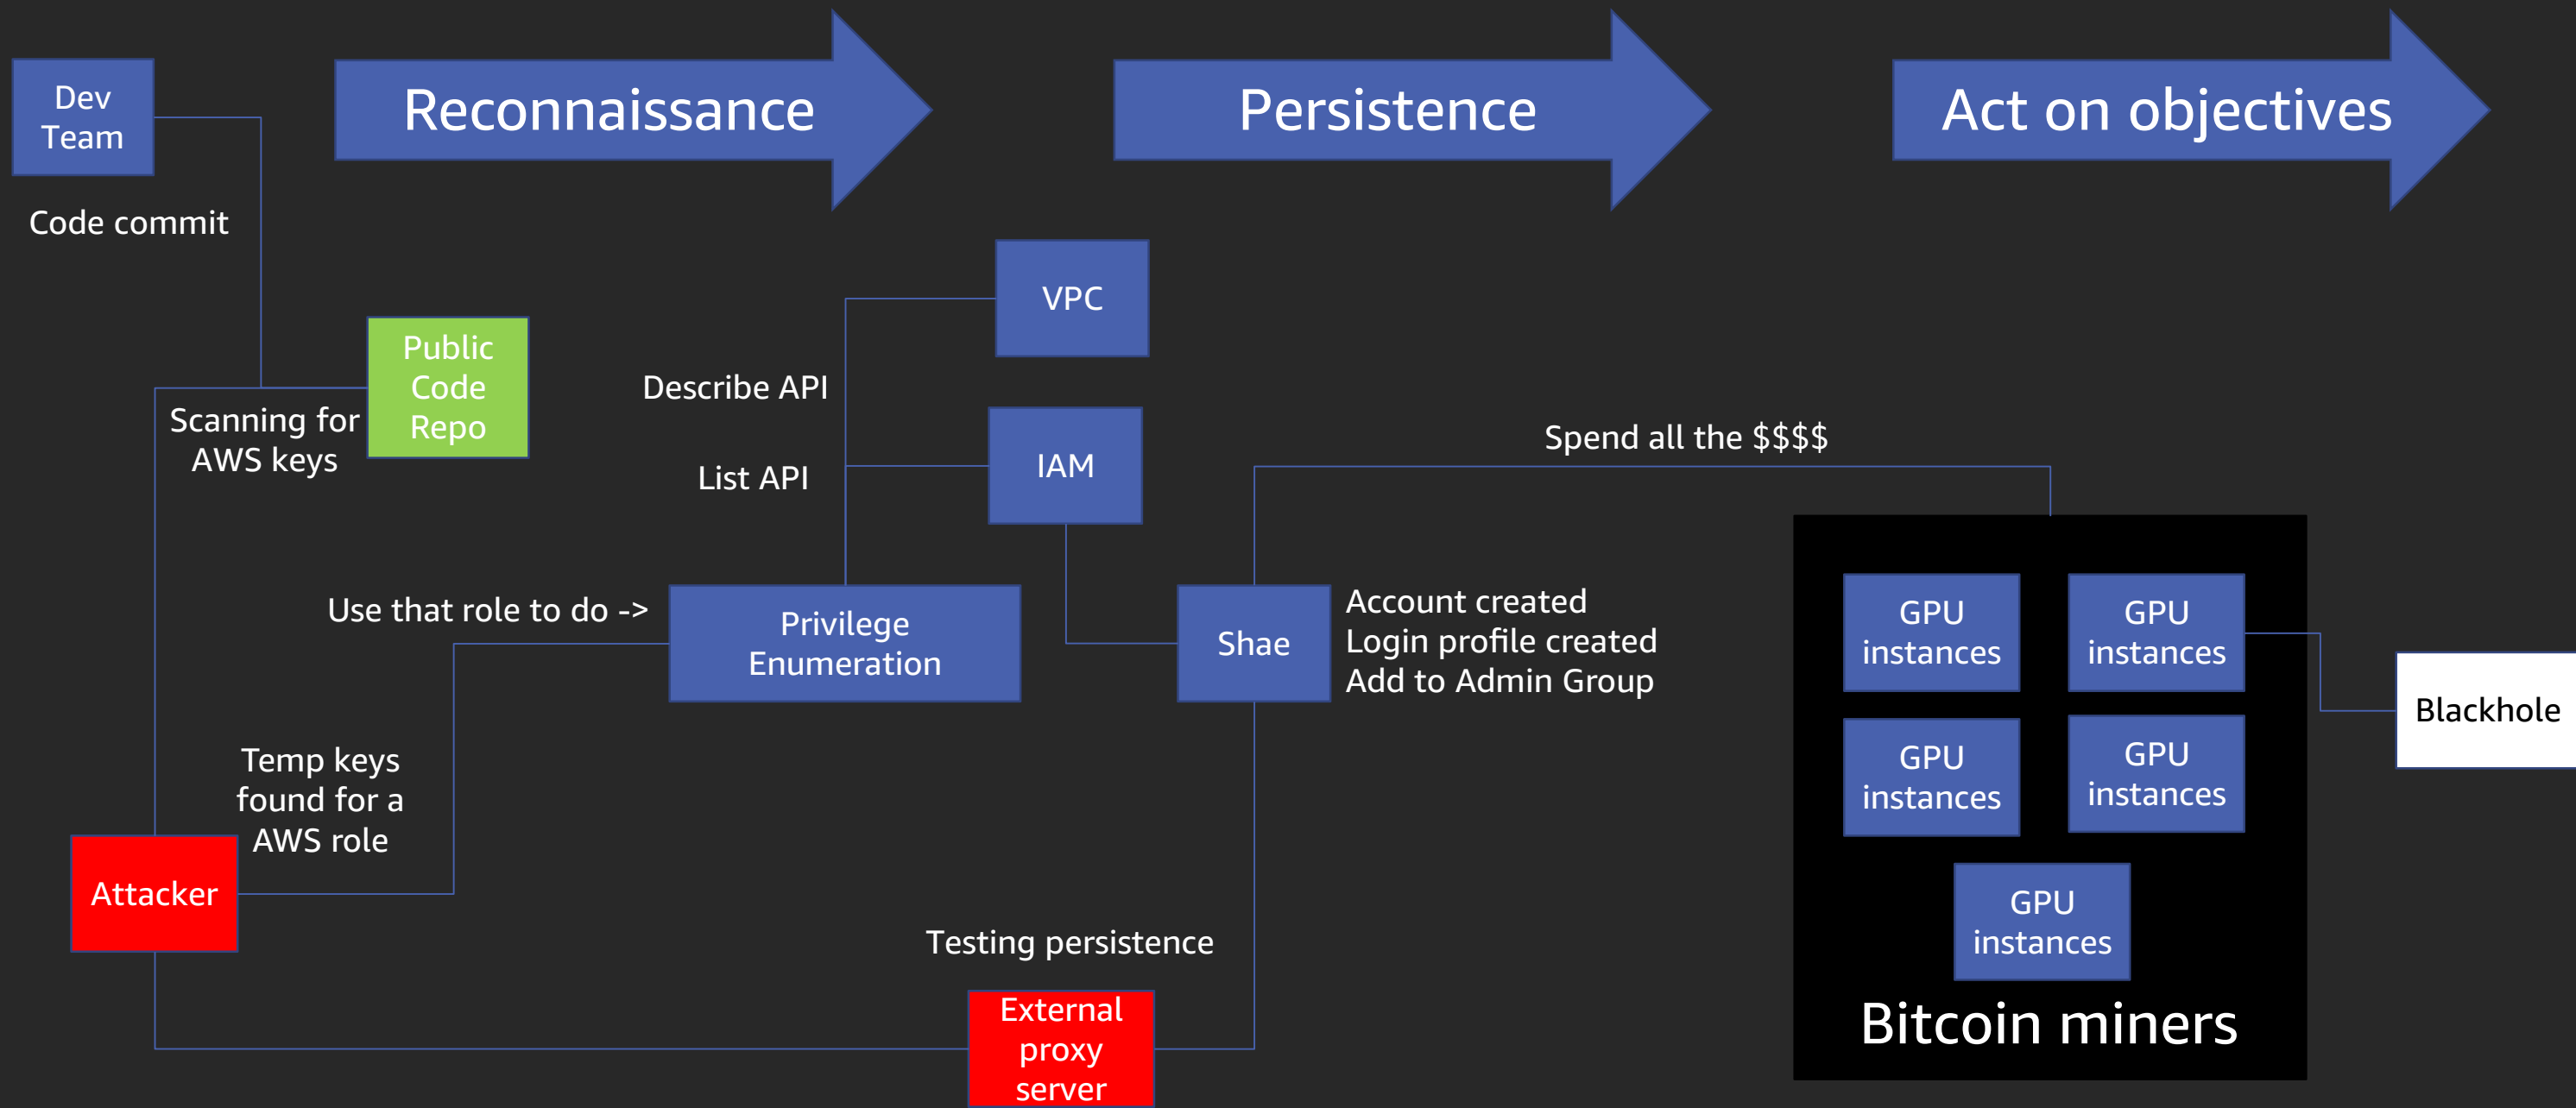

1. Browse to the URL
2. Choose **Module 5: re:Invent 2019** in the outline on the left
3. Run through the module (~15 min.) OR watch the presenter

Remember we are playing the part of a security analyst. Take good notes.

There will be prizes.

# What happened?
