Agenda

Why a multi-region architecture is important

Architecture patterns

Demo

Q&A

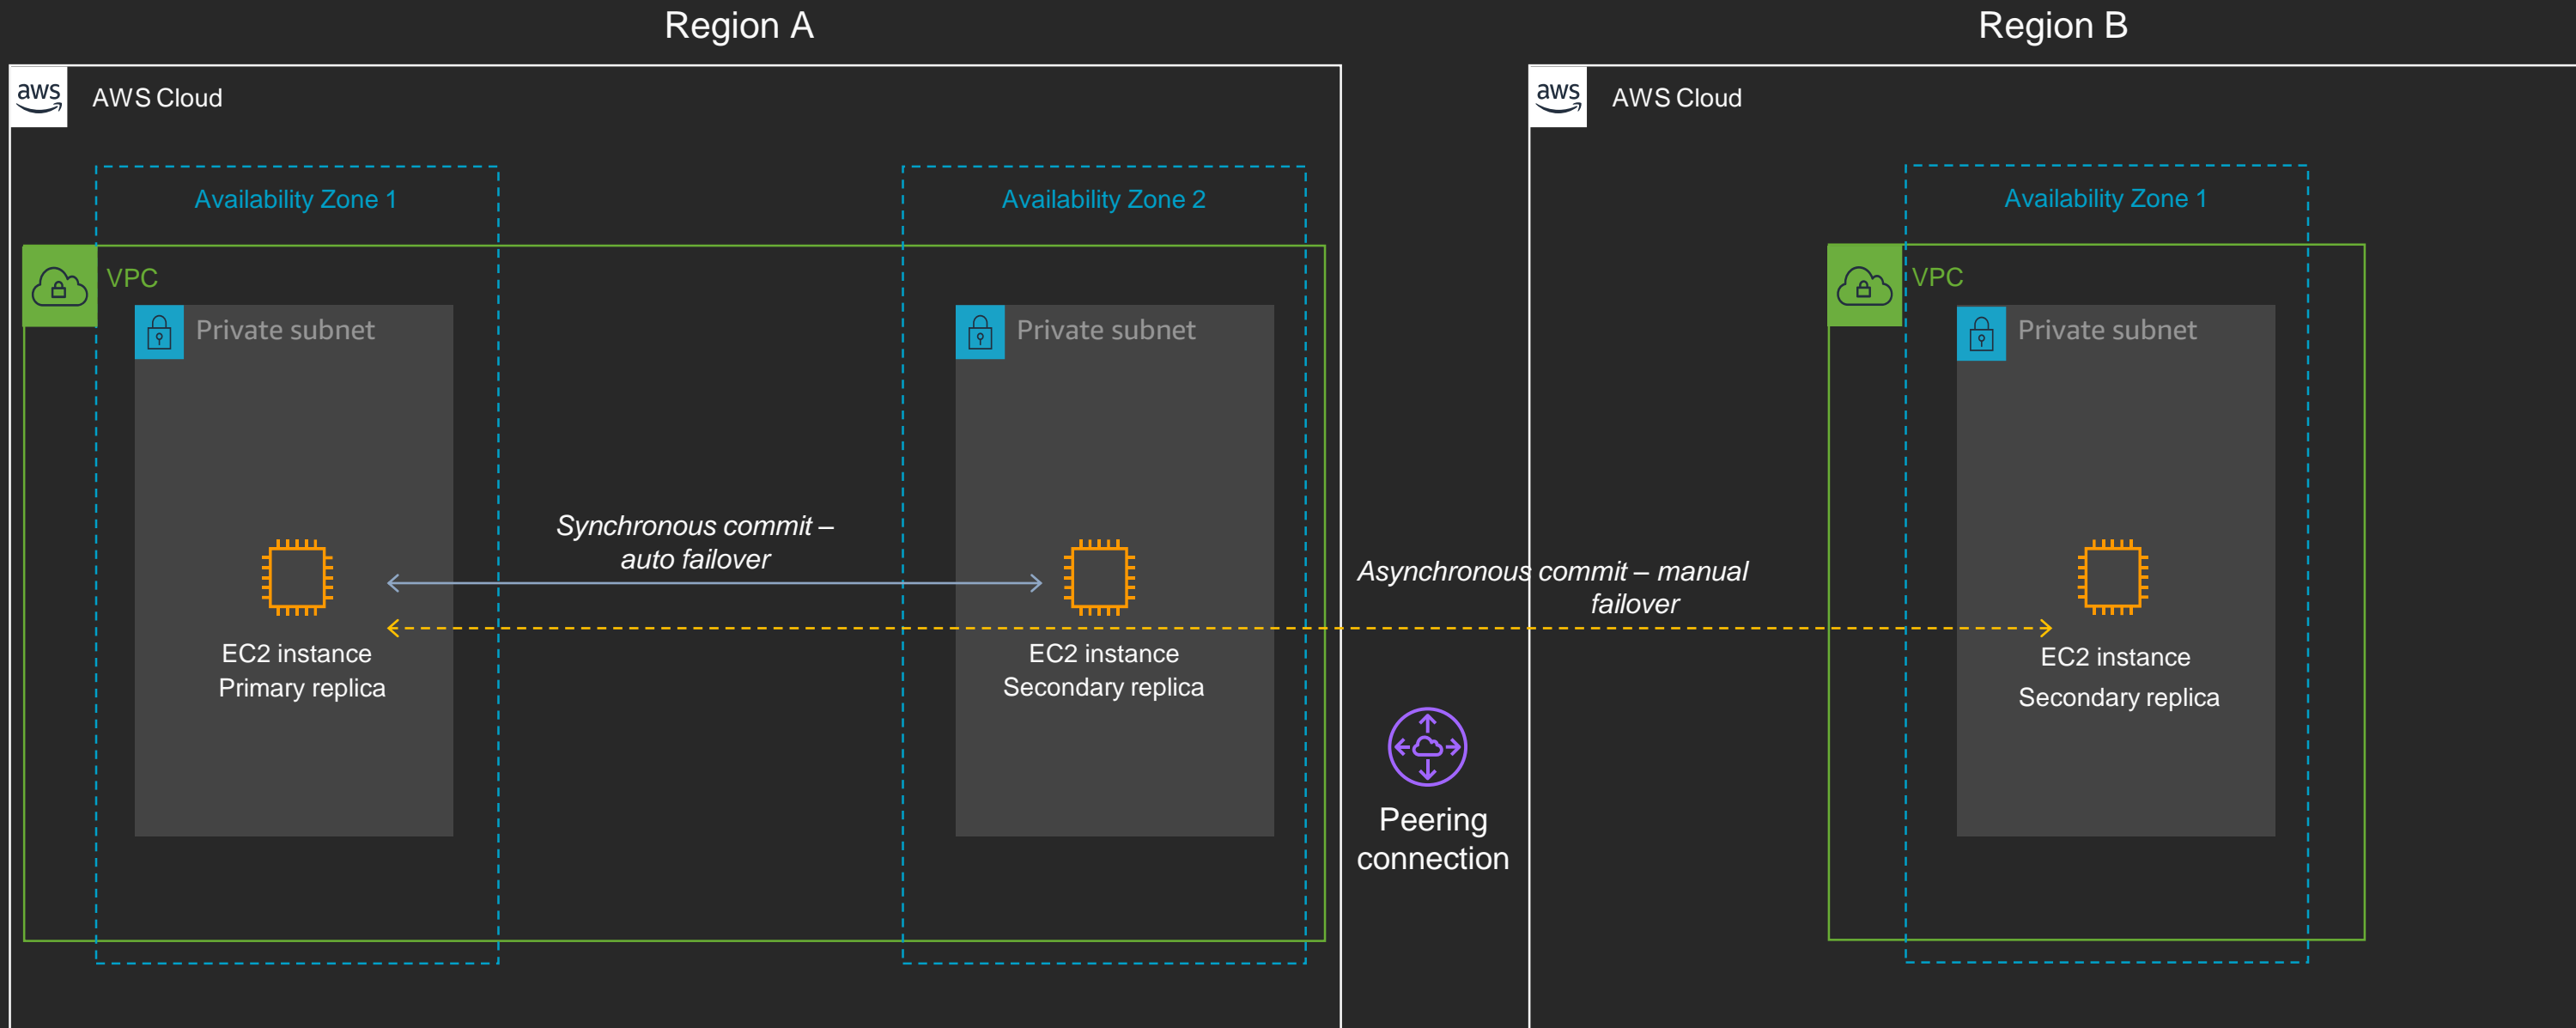

Why a multi-region architecture is important

- For those workloads that require more resiliency against a rare, unplanned event (like a region failure), and to ensure availability under any circumstances
- Serve the read workloads from a region that is closer to your user base
- Scale-out reads

Architecture patterns

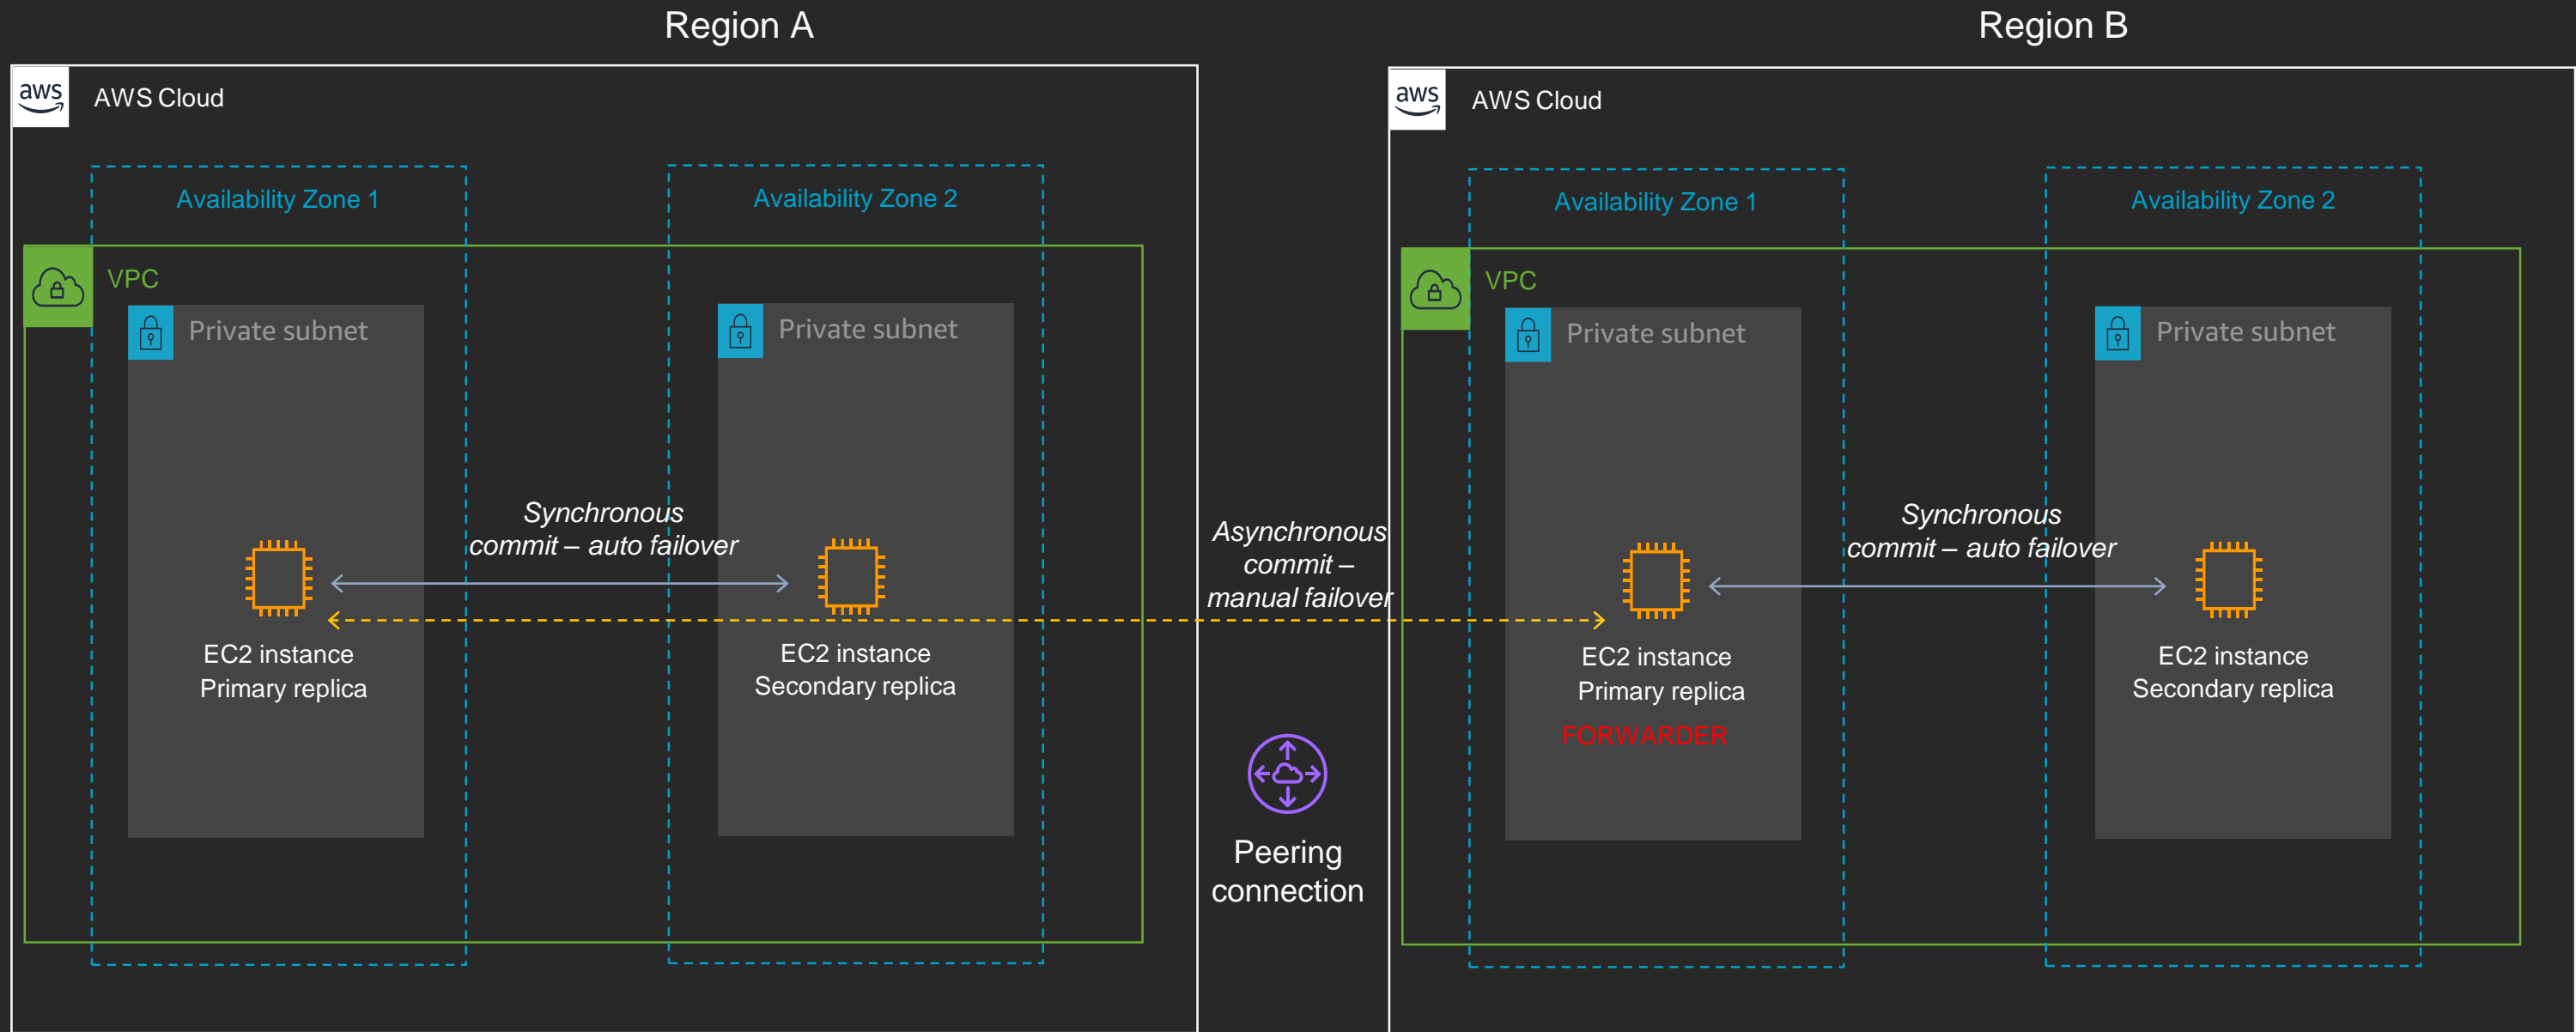

Architecture patterns

Multi-region always-on availability group—Traditional approach

Architecture patterns

Multi-region distributed availability group—Optimal approach

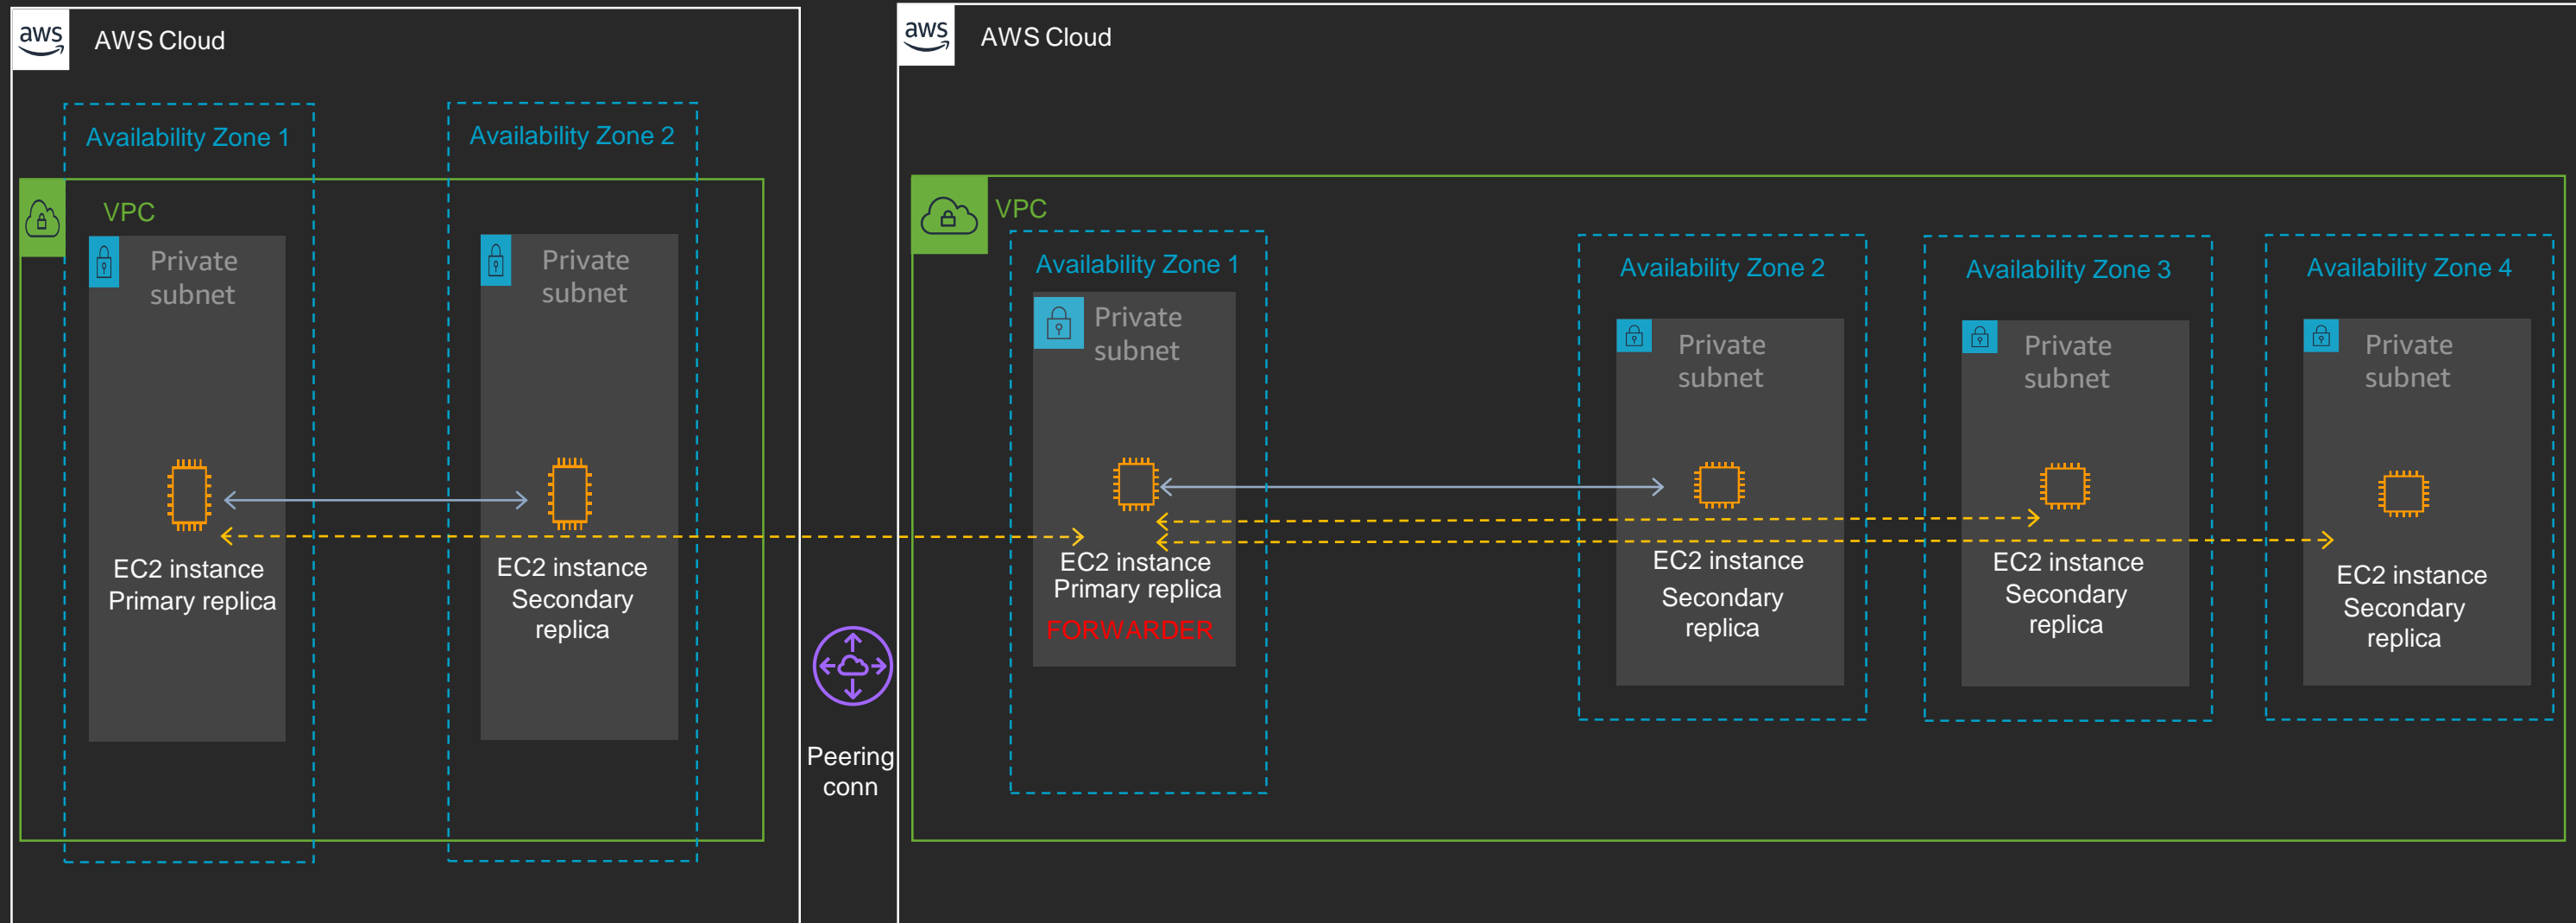

Architecture patterns

Multi-region distributed availability group—Read scale out

Region A

Region B

←→ Synchronous commit – auto failover

←- - - - -> Asynchronous commit – manual failover

Demo

Thank you!
