Agenda

- Problem statement
- Containers and Amazon ECR
- Kubernetes and cdk8s
- Amazon EKS and AWS CDK
- Summary

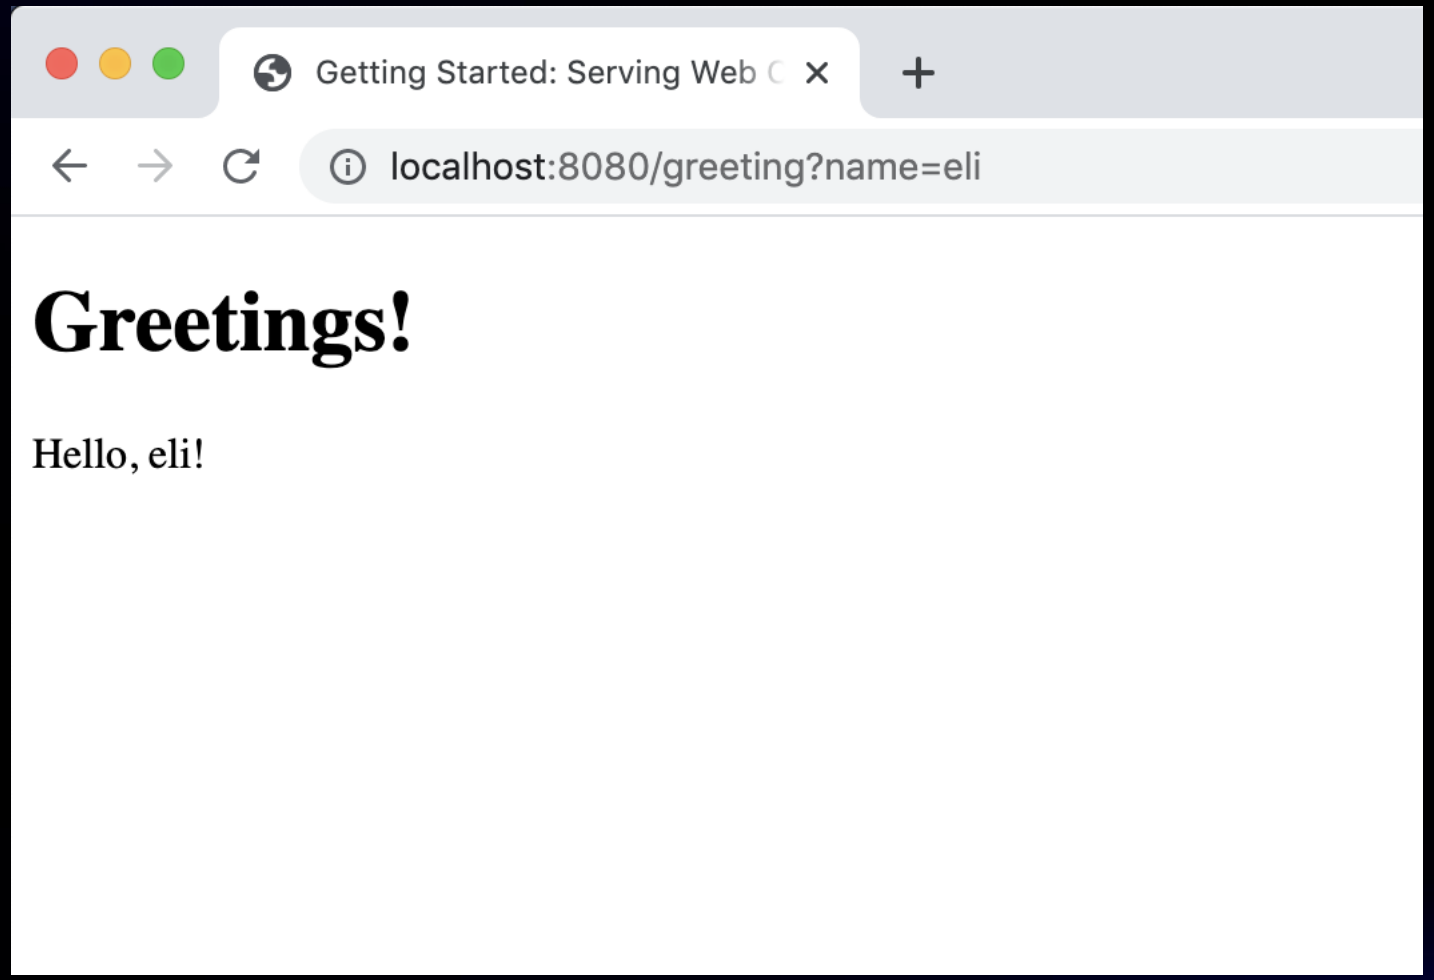

© 2021, Amazon Web Services, Inc. or its affiliates. All rights reserved.

Problem statement

How does a Java developer approach Kubernetes?

© 2021, Amazon Web Services, Inc. or its affiliates. All rights reserved.

Java Spring Boot application

Containers and Amazon ECR

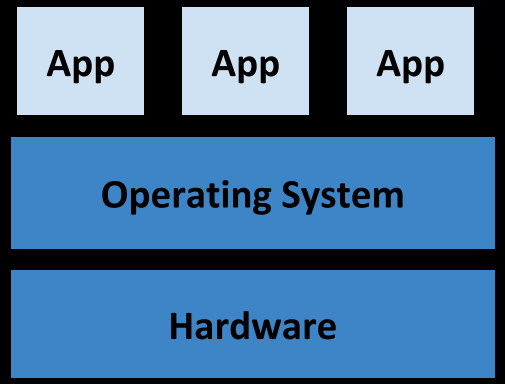

© 2021, Amazon Web Services, Inc. or its affiliates. All rights reserved.

“A container is a standard unit of software that packages up code and all its dependencies so the application runs quickly and reliably from one computing environment to another.”

Docker

What is Kubernetes?

Kubernetes is a container orchestration system that started as an open-source project from Google

Heart of the cloud native movement

Designed to run everywhere from on-premises to the cloud

Automatic scaling and self-healing

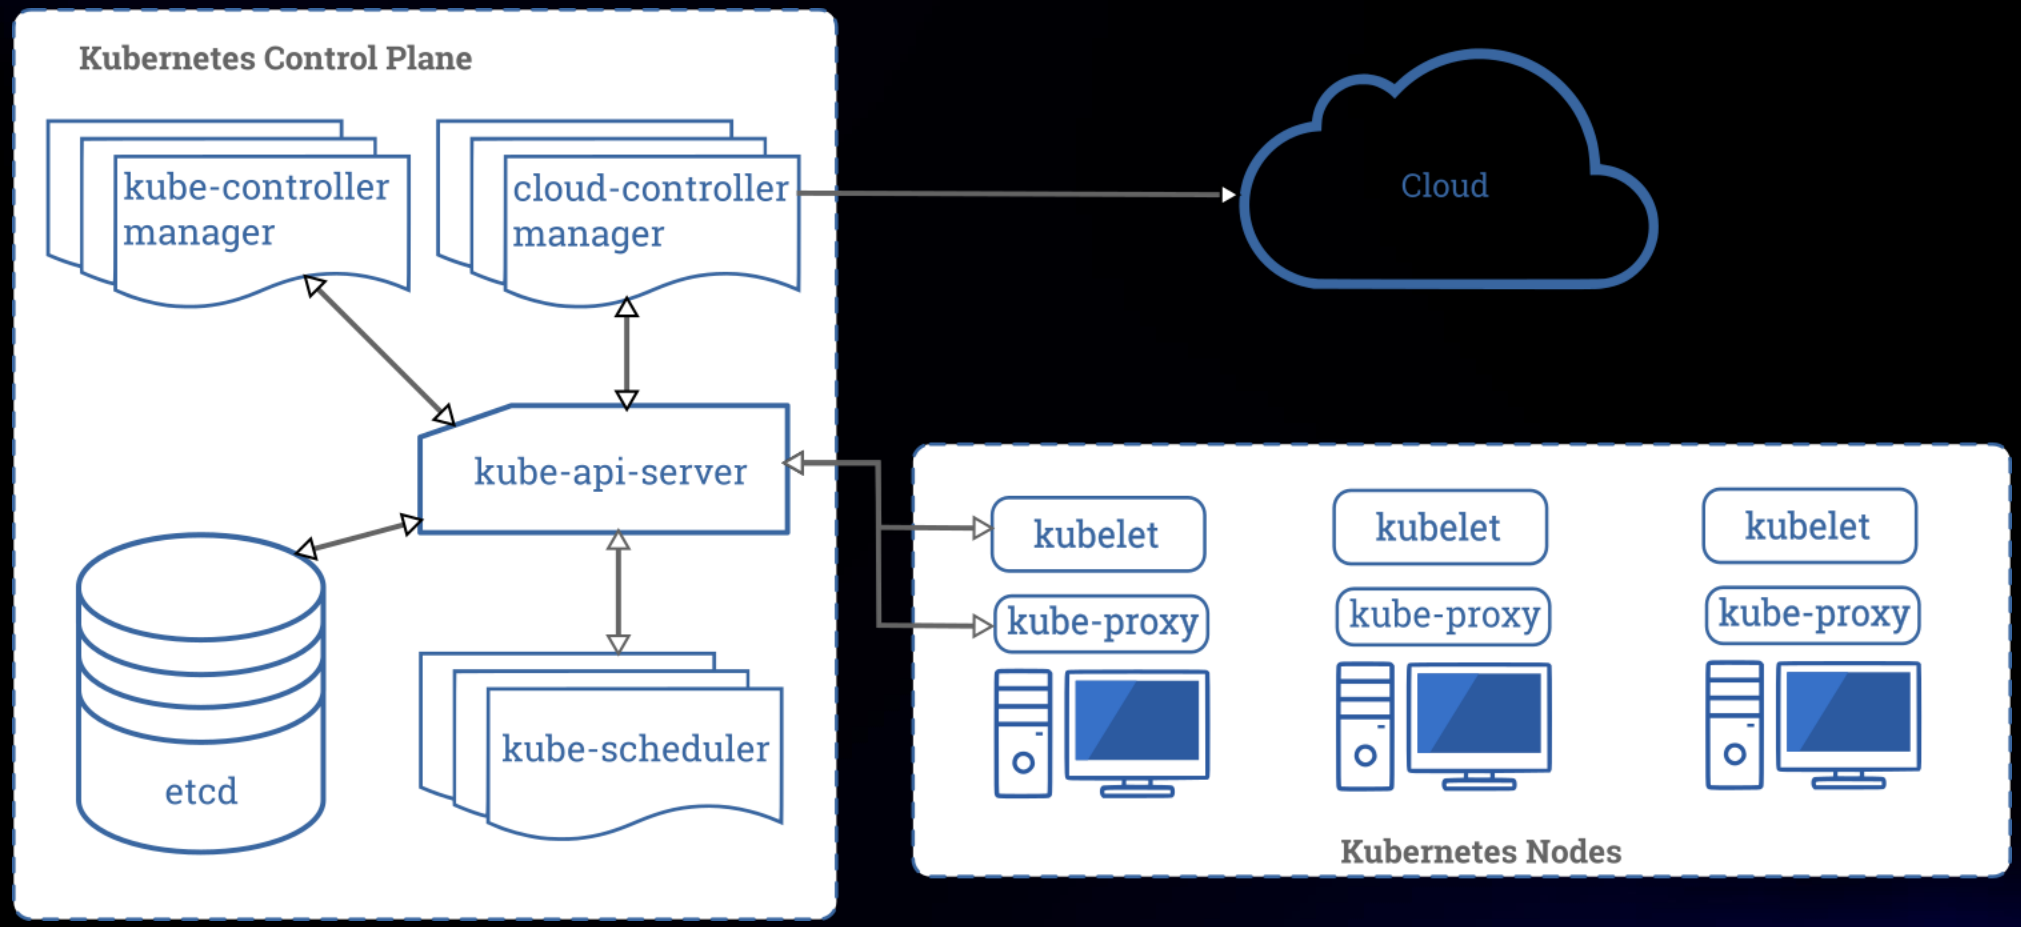

Innovative declarative resource model

aws

Architecture

https://kubernetes.io/docs/concepts/overview/components/

© 2021, Amazon Web Services, Inc. or its affiliates. All rights reserved.

Pod

A pod is the basic unit of Kubernetes – it generally represents a container

Most resources have 4 fields:

- apiVersion
- kind
- metadata
- spec

Don’t create these yourself

```yaml
apiVersion: v1
kind: Pod
metadata:
  name: nginx
  labels:
    key: value
spec:
  containers:
  - name: nginx
    image: nginx:1.14.2
    ports:
    - containerPort: 80
      protocol: TCP
```

Deployment

A deployment represents a single app/service – this is the most common resource you'll use

Completely isolated from other deployments by default

Notice the spec.template field is the same as the pod

```yaml
apiVersion: apps/v1
kind: Deployment
metadata:
  name: nginx-deployment
  labels:
    app: nginx
spec:
  replicas: 3
  selector:
    matchLabels:
      app: nginx
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
      - name: nginx
        image: nginx:1.14.2
        ports:
        - containerPort: 80
```

Service

A service is how we make deployments accessible inside and outside our cluster

Three different types:

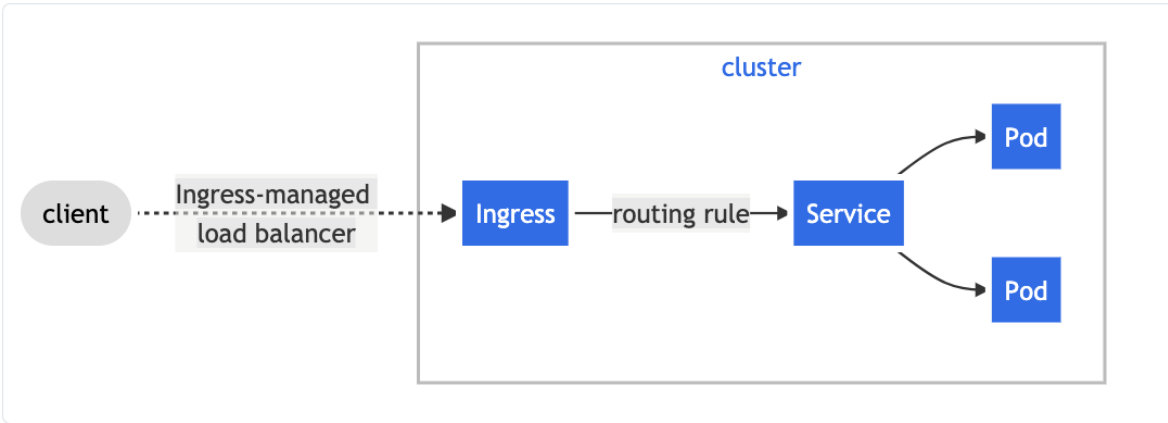

- ClusterIP
- NodePort
- LoadBalancer

```yaml
apiVersion: v1
kind: Service
metadata:
  name: nginx-service
spec:
  type: LoadBalancer
  selector:
    app: nginx
  ports:
    - port: 80
      targetPort: 80
```

AWS Cloud Development Kit (AWS CDK)

An open-source multi-language software development framework
for modeling AWS Cloud infrastructure as reusable components

Familiar
Your language
Just code

Tool Support
AutoComplete
Inline documentation

Abstraction
Sane defaults
Reusable classes

© 2021, Amazon Web Services, Inc. or its affiliates. All rights reserved.

AWS CDK: In a nutshell

```typescript
export class SimpleVpc extends cdk.Stack {
  constructor(scope: cdk.Construct, id: string) {
    super(scope, id);

    new ec2.Vpc(this, 'Vpc')
  }
}
```

cdk synth

CDK for Kubernetes (cdk8s)

An open-source multi-language software development framework for modeling Kubernetes resources as reusable components

Go from code to config

Define Kubernetes applications and architectures using familiar programming languages

Cut, copy & paste

Turn best practices into code libraries and share easily

Run everywhere

cdk8s runs locally and generates YAML you can deploy to any cluster, anywhere

aws

cdk8s: In a nutshell

```typescript
export class MyChart extends Chart {

  constructor(scope: Construct, name: string) {
    super(scope, name);

    new kplus.Deployment(this, 'Deployment', {
      containers: [new kplus.Container({
        image: 'nginx'
      })]
    });

  }
}
```

cdk8s synth →

```yaml
apiVersion: "apps/v1"
kind: "Deployment"
metadata:
  name: "reinvent-deployment-58e8fcdb"
spec:
  replicas: 1
  selector:
    matchLabels:
      cdk8s.deployment: "reinvent-Deployment-074884f1"
  template:
    metadata:
      labels:
        cdk8s.deployment: "reinvent-Deployment-074884f1"
    spec:
      containers:
        - env: []
          image: "nginx"
          imagePullPolicy: "Always"
          name: "main"
          ports: []
          volumeMounts: []
      volumes: []
```
